DATABASE MANAGEMENT SYSTEMS LABORATORY

Laboratory Manual Note Book

Name :

Year / Branch / Section :

Register No. :

Semester :

Academic Year :

P Abhignya - 221701002

Vision

To promote highly Ethical and Innovative Computer Professionals through excellence in teaching, training and research.

Mission

- To produce globally competent professionals, motivated to learn the emerging technologies and to be innovative in solving real world problems.
- To promote research activities amongst the students and the members of faculty that could benefit the society.
- To impart moral and ethical values in their profession.

PROGRAMME EDUCATIONAL OBJECTIVES (PEOs)

PEO 1: To equip students with essential background in computer science, basic electronics and applied mathematics.

PEO 2: To prepare students with fundamental knowledge in programming languages, and tools and enable them to develop applications.

PEO 3: To develop professionally ethical individuals enhanced with analytical skills, communication skills and organizing ability to meet industry requirements.

PROGRAMME OUTCOMES (POs)

PO1: Engineering knowledge: Apply the knowledge of Mathematics, Science, Engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.

PO2: Problem analysis: Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.

PO3: Design/development of solutions: Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate

consideration for the public health and safety, and the cultural, societal, and environmental considerations.

PO4: Conduct investigations of complex problems: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

PO5: Modern tool usage: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.

PO6: The engineer and society: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.

PO7: Environment and sustainability: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.

PO8: Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.

PO9: Individual and team work: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.

PO10: Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.

PO11: Project management and finance: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.

PO12: Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

P Abhignya - 221701002

PROGRAM SPECIFIC OUTCOMES (PSOs)

A graduate of the Computer Science and Design Program will have an

PSO 1: Ability to understand, analyze and develop efficient software solutions using suitable algorithms, data structures, and other computing techniques.

PSO 2: Ability to independently investigate a problem which can be solved by a Human Computer Interaction (HCI) design process and then design an end-to-end solution to it (i.e., from user need identification to UI design to technical coding and evaluation). Ability to effectively use suitable tools and platforms, as well as enhance them, to develop applications/products using for new media design in areas like animation, gaming, virtual reality, etc.

PSO 3: Ability to apply knowledge in various domains to identify research gaps and to provide solution to new ideas, inculcate passion towards higher studies, creating innovative career paths to be an entrepreneur and evolve as an ethically social responsible computer science and design professional.

List of Experiments			
1	Introduction to SQL : DDL,DML,DCL,TCL. SQL clause :SELECT FROM WHERE GROUPBY,HAVING,ORDERBY Using SQLite/MySQL/Oracle		
2	Creation of Views, Synonyms, Sequence, Indexes, Save point.		
3	Creating an Employee database to set various constraints and subqueries.		
4	Optimize a SQL query construct considering time complexity.		
5	Write a PL/SQL block to specify constraints by accepting input from the user.		
6	Implementation of PL/SQL Procedure (IN, OUT, INOUT) with Exception Handling.		
7	Implementation of PL/SQL Function.		
8	Implementation of PL/SQL Cursor.		
9	Implementation of PL/SQL Trigger, Packages.		
10	Implementation of NoSQL basic commands using Cassandra/Mongo DB.		
11	Implementation of Data Model in NoSQL.		
12	Implementation of Aggregation , Indexes in NoSQL.		
13	MINI PROJECT Database Connectivity with Front End Tools(Python/C/C++/JAVA)and Back End Tools(MySQL/SQLite/CASSANDRA/MONGO DB) For any problem selected, write the ER Diagram, apply ER mapping rules, normalize the relations, and follow the application development process. Make sure that the application should have five or more tables, at least one trigger and one stored procedure, using suitable frontend tool. Indicative areas include a) Inventory Control System. b) Material Requirement Processing. c) Hospital Management System. d) Railway Reservation System. e) Personal Information System. f) Web Based User Identification System. g) Timetable Management System. h) Hotel Management System i) Library Management System.		
		Contact Hours	: 60
		Total Contact Hours	: 90

Safety Precautions

- Regular Backups: Ensure regular backups of all databases to prevent data loss.
- Secure Passwords: Use complex and unique passwords for database access and change them regularly.
- Antivirus Protection: Install and maintain updated antivirus software on all laboratory computers.
- Data Encryption: Encrypt sensitive data both in transit and at rest to protect against data breaches.
- Software Updates: Keep all database management software and operating systems up to date with the latest security patches.
- Environment Control: Ensure proper environmental controls, such as temperature and humidity, to protect hardware.
- Power Protection: Use Uninterruptible Power Supplies (UPS) to prevent data loss due to power outages.

Dos:

- Regular Maintenance: Perform regular maintenance and updates on the database systems to ensure optimal performance.
- Documentation: Maintain comprehensive documentation of database structures, procedures, and security policies.
- Monitoring: Continuously monitor database performance and security to detect and respond to issues promptly.
- Training: Provide regular training to staff and students on database management best practices and security measures.
- Data Integrity: Implement and enforce data integrity constraints to maintain accurate and reliable data.

Don'ts

- Sharing Passwords: Do not share passwords or leave them written down in accessible places.
- Ignoring Errors: Do not ignore system errors or warnings; investigate and resolve them promptly.
- Unauthorized Software: Do not install unauthorized software on lab computers as it may pose security risks.
- Neglecting Backups: Do not neglect regular backups; always have a backup strategy in place.
- Weak Passwords: Do not use weak or easily guessable passwords.
- Bypassing Security: Do not bypass or disable security features for convenience.
- Unverified Sources: Do not download or install software from unverified sources as they may contain malware.

- Public Wi-Fi: Avoid accessing the database from public Wi-Fi networks to prevent unauthorized interception of data.

Definition of a Relational Database

A relational database is a collection of relations or two-dimensional tables.

Terminologies Used in a Relational Database

1. A single **ROW** or table representing all data required for a particular employee. Each row should be identified by a primary key which allows no duplicate rows.
2. A **COLUMN** or attribute containing the employee number which identifies a unique employee. Here Employee number is designated as a primary key ,must contain a value and must be unique.
3. A column may contain foreign key. Here Dept_ID is a foreign key in employee table and it is a primary key in Department table.
4. A Field can be found at the intersection of a row and column. There can be only one value in it. Also it may have no value. This is called a null value.

EMP ID	FIRST NAME	LAST NAME	EMAIL
100	King	Steven	Sking
101	John	Smith	Jsmith
102	Neena	Bai	Neenba
103	Eex	De Haan	Ldehaan

Relational Database Properties

A relational database :

- Can be accessed and modified by executing structured query language (SQL) statements.
- Contains a collection of tables with no physical pointers.
- Uses a set of operators

Relational Database Management Systems

RDBMS refers to a relational database plus supporting software for managing users and processing SQL queries, performing backups/restores and associated tasks. (Relational Database Management System) Software for storing data using SQL (structured query language). A relational database uses SQL to store data in a series of tables that not only record existing relationships between data items, but which also permit the data to be joined in new relationships. SQL (pronounced 'sequel') is based on a system of algebra developed by E F Codd, an IBM scientist who first defined the relational model in 1970. Relational databases are optimized for storing transactional data, and the majority of modern business software applications therefore use an RDBMS as their data store. The leading RDBMS vendors are Oracle, IBM and Microsoft.

The first commercial RDBMS was the Multics Relational Data Store, first sold in 1978. INGRES, Oracle, Sybase, Inc., Microsoft Access, and Microsoft SQL Server are well-known database products and companies. Others include PostgreSQL, SQL/DS, and RDB. A relational database management system (RDBMS) is a program that lets you create, update, and administer a relational database. Most commercial RDBMS's use the Structured Query Language (SQL) to access the database, although SQL was invented after the development of the relational model and is not necessary for its use. The leading RDBMS products are Oracle, IBM's DB2 and Microsoft's SQL Server. Despite repeated challenges by competing technologies, as well as the claim by some experts that no current RDBMS has fully implemented relational principles, the majority of new corporate databases are still being created and managed with an RDBMS.

SQL Statements

1. Data Retrieval(DR)
2. Data Manipulation Language(DML)

3. Data Definition Language(DDL)
4. Data Control Language(DCL)
5. Transaction Control Language(TCL)

P Abhignya - 221701002

TYP E	STATEMEN T	DESCRIPTION
DR	SELECT	Retrieves the data from the database
DML	1.INSERT 2.UPDATE 3.DELETE 4.MERGE	Enter new rows, changes existing rows, removes unwanted rows from tables in the database respectively.
DDL	1.CREATE 2.ALTER 3.DROP 4.RENAME 5.TRUNCATE	Sets up, changes and removes data structures from tables.
TCL	1.COMMIT 2.ROLLBACK 3.SAVEPOINT T	Manages the changes made by DML statements. Changes to the data can be grouped together into logical transactions.
DCL	1.GRANT 2.REVOKE	Gives or removes access rights to both the oracle database and the structures within it.

DATA TYPES

1. Character Data types:

- Char – fixed length character string that can varies between 1-2000 bytes

- Varchar / Varchar2 – variable length character string, size ranges from 1-4000 bytes.it saves the disk space(only length of the entered value will be assigned as the size of column)
 - Long - variable length character string, maximum size is 2 GB
2. **Number Data types :** Can store +ve,-ve,zero,fixed point, floating point with 38 precision.
- Number – {p=38,s=0}
 - Number(p) - fixed point
 - Number(p,s) –floating point (p=1 to 38,s= -84 to 127)
3. **Date Time Data type:** used to store date and time in the table.
- DB uses its own format of storing in fixed length of 7 bytes for century, date, month, year, hour, minutes, and seconds.
 - Default data type is “dd-mon-yy”
 - New Date time data types have been introduced. They are TIMESTAMP- Date with fractional seconds
 - INTERVAL YEAR TO MONTH-stored as an interval of years and months
 - INTERVAL DAY TO SECOND-stored as o interval of days to hour's minutes and seconds
4. **Raw Data type:** used to store byte oriented data like binary data and byte string.
5. **Other :**
- CLOB – stores character object with single byte character.
 - BLOB – stores large binary objects such as graphics, video, sounds.
 - BFILE – stores file pointers to the LOB's.

Creating of Base Table and Managing Tables

1. Create MY_EMPLOYEE table with the following structure

NAME	NULL?	TYPE
ID	Not null	Number(4)
Last_name		Varchar(25)
First_name		Varchar(25)
Userid		Varchar(25)
Salary		Number(9,2)

2. Add the first and second rows data to MY_EMPLOYEE table from the following sample data.

ID	Last_name	First_name	Userid	salary
1	Patel	Ralph	rpatel	895
2	Dancs	Betty	bdancs	860
3	Biri	Ben	bbiri	1100
4	Newman	Chad	Cnewman	750
5	Ropebur	Audrey	aropebur	1550

3. Display the table with values.
4. Populate the next two rows of data from the sample data. Concatenate the first letter of the first_name with the first seven characters of the last_name to produce Userid.
5. Delete Betty dancs from MY_EMPLOYEE table.
6. Empty the fourth row of the emp table.
7. Make the data additions permanent.
8. Change the last name of employee 3 to Drexler.
9. Change the salary to 1000 for all the employees with a salary less than 900.

DATA MANIPULATIONS

Create the following table with the given structure

EMPLOYEES TABLE

NAME	NULL?	TYPE
Employee_id	Not null	Number(6)
First_Name		Varchar(20)
Last_Name	Not null	Varchar(25)
Email	Not null	Varchar(25)
Phone_Number		Varchar(20)
Hire_date	Not null	Date
Job_id	Not null	Varchar(10)
Salary		Number(8,2)
Commission_pct		Number(2,2)
Manager_id		Number(6)
Department_id		Number(4)

Employee_ID	First_Name	Last_Name	Email	Phone_Number	Hire_Date	Job_ID	Salary	Commission_Pct	Manager_ID	Department_ID
1	John	Doe	johndoe@example.com	555-5555	1/1/2023	IT_PROG	5000	NULL	100	60
2	Jane	Austin	janeaustin@example.com	555-5556	2/1/2023	SA_REP	6000	0.1	101	70
3	Mike	Smith	mikesmith@example.com	555-5557	3/1/2023	AD_VP	7000	0.15	102	80
4	Anna	Austin	anna.austin@example.com	555-5558	4/1/2023	FI_MGR	4800	0.2	103	60
5	Bob	Brown	bob.brown@example.com	555-5559	5/1/2023	MK_MAN	4500	NULL	104	70
6	Alice	Johnson	alice.johnson@example.com	555-5560	6/1/2023	HR_REP	5500	0.05	100	60
7	Steve	Wilson	steve.wilson@example.com	555-5561	7/1/2023	IT_PROG	5200	NULL	100	80
8	Laura	White	laura.white@example.com	555-5562	8/1/2023	AD_ASST	4700	NULL	105	70
9	David	Harris	david.harris@example.com	555-5563	9/1/2023	MK REP	5100	0.1	101	60
10	Emma	Martinez	emmarmartinez@example.com	555-5564	10/1/2023	SA_MAN	4900	NULL	104	80

- a) Find out the employee id, names, salaries of all the employees

Query –

```
SELECT Employee_ID, First_Name, Last_Name, Salary  
FROM employees;
```

- b) List out the employees who works under manager 100

Query –

```
SELECT Employee_ID, First_Name, Last_Name  
FROM employees  
WHERE Manager_ID = 100;
```

- c) Find the names of the employees who have a salary greater than or equal to 4800

Query –

```
SELECT First_Name, Last_Name  
FROM employees  
WHERE Salary >= 4800;
```

- d) List out the employees whose last name is AUSTIN

Query –

```
SELECT First_Name, Last_Name  
FROM employees  
WHERE Last_Name = 'Austin';
```

- e) Find the names of the employees who works in departments 60,70 and 80

Query –

```
SELECT First_Name, Last_Name  
FROM employees  
WHERE Department_ID IN (60, 70, 80);
```

- f) Display the unique Manager_Id.

Query –

```
SELECT DISTINCT Manager_ID  
FROM employees;
```

Ex. No. : **02**

Register No.: **221701002**

Name: **P Abhignya**

Creating and Managing Tables

OBJECTIVE

After the completion of this exercise, students should be able to do the following:

- Create tables
- Describing the data types that can be used when specifying column definition
- Alter table definitions
- Drop, rename, and truncate tables

NAMING RULES

Table names and column names:

- Must begin with a letter
- Must be 1-30 characters long
- Must contain only A-Z, a-z, 0-9, _, \$, and #
- Must not duplicate the name of another object owned by the same user
- Must not be an oracle server reserve words
- 2 different tables should not have same name.
- Should specify a unique column name.
- Should specify proper data type along with width
- Can include “not null” condition when needed. By default it is ‘null’.

The CREATE TABLE Statement

Table: Basic unit of storage; composed of rows and columns

Syntax: 1 Create table table_name (column_name1 data_type (size)
column_name2 data_type (size)...);

Syntax: 2 Create table table_name (column_name1 data_type (size) constraints,
column_name2 data_type constraints ...);

Example:

Create table employees (employee_id number(6), first_name varchar2(20), ..job_id
varchar2(10), CONSTRAINT emp_emp_id_pk PRIMARY KEY (employee_id));

Tables Used in this course

Creating a table by using a Sub query

SYNTAX

// CREATE TABLE table_name(column_name type(size)...);

Create table table_name as select column_name1,column_name2,.....column_namen from
table_name where predicate;

AS Subquery

Subquery is the select statement that defines the set of rows to be inserted into the new table.

Example

Create table dept80 as select employee_id, last_name, salary*12 Annsal, hire_date
from employees where dept_id=80;

The ALTER TABLE Statement

The ALTER statement is used to

- Add a new column
- Modify an existing column
- Define a default value to the new column
- Drop a column
- To include or drop integrity constraint.

SYNTAX

ALTER TABLE table_name ADD /MODIFY(Column_name type(size));

ALTER TABLE table_name DROP COLUMN (Column_nname);

ALTER TABLE ADD CONSTRAINT Constraint_name PRIMARY KEY (Colum_Name);

Example:

Alter table dept80 add (jod_id varchar2(9));

Alter table dept80 modify (last_name varchar2(30));

Alter table dept80 drop column job_id;

NOTE: Once the column is dropped it cannot be recovered.

DROPPING A TABLE

- All data and structure in the table is deleted.
- Any pending transactions are committed.
- All indexes are dropped.
- Cannot roll back the drop table statement.

Syntax:

Drop table tablename;

Example:

Drop table dept80;

RENAMING A TABLE

To rename a table or view.

Syntax

RENAME old_name to new_name

Example:

Rename dept to detail_dept;

TRUNCATING A TABLE

Removes all rows from the table.

Releases the storage space used by that table.

Syntax

TRUNCATE TABLE *table_name*;

Example:

TRUNCATE TABLE copy_emp;

Find the Solution for the following:

Create the following tables with the given structure EMPLOYEES TABLE

NAME	NULL?	TYPE
Employee_id	Not null	Number(6)
First_Name		Varchar(20)
Last_Name	Not null	Varchar(25)
Email	Not null	Varchar(25)
Phone_Number		Varchar(20)
Hire_date	Not null	Date
Job_id	Not null	Varchar(10)
Salary		Number(8,2)
Commission_pct		Number(2,2)
Manager_id		Number(6)
Department_id		Number(4)

DEPARTMENT TABLE

NAME	NULL?	TYPE
Dept_id	Not null	Number(6)
Dept_name	Not null	Varchar(20)
Manager_id		Number(6)
Location_id		Number(4)

JOB_GRADE TABLE

NAME	NULL?	TYPE
Grade_level		Varchar(2)
Lowest_sal		Number
Highest_sal		Number

LOCATION TABLE

NAME	NULL?	TYPE
Location_id	Not null	Number(4)
St_addr		Varchar(40)
Postal_code		Varchar(12)
City	Not null	Varchar(30)
State_province		Varchar(25)
Country_id		Char(2)

- 1) Create the DEPT table based on the DEPARTMENT following the table instance chart below. Confirm that the table is created.

Column name	ID	NAME
Key Type		
Nulls/Unique		
FK table		
FK column		
Data Type	Number	Varchar2
Length	7	25

Query –
 create table dept (id number (7) , name varchar2 (25));

- 2) Create the EMP table based on the following instance chart. Confirm that the table is created.

Column name	ID	LAST_NAME	FIRST_NAME	DEPT_ID
Key Type				
Nulls/Unique				
FK table				
FK column				
Data Type	Number	Varchar2	Varchar2	Number
Length	7	25	25	7

Query –

```
Create table emp ( Id number (7), last_name varchar2 (25), first_name varchar2(25) , Dept_id number(7));
```

- 3) Modify the EMP table to allow for longer employee last names. Confirm the

Query –

```
ALTER table emp MODIFY(last_name varchar2(50));
```

- 4) Create the EMPLOYEES2 table based on the structure of EMPLOYEES table. Include Only the Employee_id, First_name, Last_name, Salary and Dept_id coloumns. Name the columns Id, First_name, Last_name, salary and Dept_id respectively.

Query –

```
Create table Employee2 (ID Number(6) not null, First_name varchar2(20), Last_name varchar2(25) not null, Salary number (8,2), Dept_id number(4));
```

- 5) Drop the EMP table.

Query –

```
Drop table emp;
```

- 6) Rename the EMPLOYEES2 table as EMP.

Query –

```
Rename Employee2 to emp;
```

- 7) Add a comment on DEPT and EMP tables. Confirm the modification by describing the table.

Query –

```
Alter table dept add ( dept_id number(7));  
Alter table emp drop salary;
```

- 8) Drop the First_name column from the EMP table and confirm it.

Query –

```
Alter table emp drop First_name;
```

P Abhignya - 221701002

Ex. No. : **02**

Register No.: **221701002**

Name: **P Abhignya**

Manipulating Data

OBJECTIVE

After, the completion of this exercise the students will be able to do the following

- Describe each DML statement
- Insert rows into tables
- Update rows into table
- Delete rows from table
- Control Transactions

A DML statement is executed when you:

- Add new rows to a table
- Modify existing rows
- Removing existing rows

A transaction consists of a collection of DML statements that form a logical unit of work.

To Add a New Row

INSERT Statement

Syntax

INSERT INTO table_name VALUES (column1 values, column2 values, ..., columnn values);

Example:

INSERT INTO department (70, ‘Public relations’, 100,1700);

Inserting rows with null values

Implicit Method: (Omit the column)

INSERT INTO department VALUES (30,’purchasing’);

Explicit Method: (Specify NULL keyword)

```
INSERT INTO department VALUES (100,'finance', NULL, NULL);
```

Inserting Special Values

Example:

Using SYSDATE

```
INSERT INTO employees VALUES (113,'louis', 'popp', 'lpopp','5151244567',SYSDATE,  
'ac_account', 6900, NULL, 205, 100);
```

Inserting Specific Date Values

Example:

```
INSERT INTO employees VALUES ( 114,'den', 'raphealy', 'drapheal', '5151274561',  
TO_DATE('feb 3,1999','mon, dd ,yyyy'), 'ac_account', 11000,100,30);
```

To Insert Multiple Rows

& is the placeholder for the variable value

Example:

```
INSERT INTO department VALUES (&dept_id, &dept_name, &location);
```

Copying Rows from another table

➤ Using Subquery

Example:

```
INSER INTO sales_reps(id, name, salary, commission_pct)  
SELECT employee_id, Last_name, salary, commission_pct  
FROM employees WHERE job_id LIKE '%REP');
```

CHANGING DATA IN A TABLE

UPDATE Statement

Syntax1: (to update specific rows)

```
UPDATE table_name SET column=value WHERE condition;
```

Syntax 2: (To update all rows)

```
UPDATE table_name SET column=value;
```

Updating columns with a subquery

```
UPDATE employees  
SET job_id= (SELECT job_id  
FROM employees  
WHERE employee_id=205)  
WHERE employee_id=114;
```

REMOVING A ROW FROM A TABLE

DELETE STATEMENT

Syntax

```
DELETE FROM table_name WHERE conditions;
```

Example:

```
DELETE FROM department WHERE dept_name='finance';
```

Find the Solution for the following:

1. Create MY_EMPLOYEE table with the following structure

NAME	NULL?	TYPE
ID	Not null	Number(4)
Last_name		Varchar(25)
First_name		Varchar(25)
Userid		Varchar(25)
Salary		Number(9,2)

2. Add the first and second rows data to MY_EMPLOYEE table from the following sample data.

ID	Last_name	First_name	Userid	salary
1	Patel	Ralph	rpatel	895
2	Dancs	Betty	bdancs	860
3	Biri	Ben	bbiri	1100
4	Newman	Chad	Cnewman	750
5	Ropebur	Audrey	aropebur	1550

3. Display the table with values.

Query –

4. Populate the next two rows of data from the sample data. Concatenate the first letter of the first_name with the first seven characters of the last_name to produce Userid.

Query -

Select CONCAT(substr(First_name 1, 1), substr>Last_name, 1,7)) from MY_EMPLOYEE;

5. Make the data additions permanent.

Query –

UPDATE MY_EMPLOYEE set user_id = concat(substr(first_name, 1,1), substr(last_name, 1,7)) where id in (3,4);

6. Change the last name of employee 3 to Drexler.

Query –

Update my_employee set last_name = 'Drexler'
Where id = 3;

7. Change the salary to 1000 for all the employees with a salary less than 900.

Query –

Update my_employee set salary = 1000 where salary < 900;

8. Delete Betty dancs from MY_EMPLOYEE table.

Query –

Delete from my_employee where id =2;

9. Empty the fourth row of the emp table.

Query –

Delete from emp where id = 4;

Working With Column, Characters and rows

Global Fast Foods Database Tables

1. The manager of Global Fast Foods would like to send out coupons for the upcoming sale. He wants to send one coupon to each household. Create the SELECT statement that returns the customer last name and a mailing address.

Query –

Select last_name, address from F-CUSTOMERS;

2. Each statement below has errors. Correct the errors and execute the query in Oracle Application Express.

a. SELECT first name FROM f_staffs;

Query – select first_name from f-staffs;

b. SELECT first_name |" " | last_name AS "DJs on Demand Clients" FROM d_clients;

Query – select first_name |“ ”| last_name as “DJs on Demand Clients” from d_clients;

c. SELECT DISCTINCT f_order_lines FROM quantity;

Query – select distinct (quantity) from f_order_lines;

d. SELECT order number FROM f_orders;

Query – select order_number from f-orders;

3. Sue, Bob, and Monique were the employees of the month. Using the f_staffs table, create a SELECT statement to display the results as shown in the Super Star chart.

Super Star
*** Sue *** Sue ***
*** Bob *** Bob ***
*** Monique *** Monique ***

Query –

Select |***| first_name |***| first_name as “super star” from f-staffs;

4.Which of the following is TRUE about the following query?

SELECT first_name, DISTINCT birthdate
FROM f_staffs;

- a. Only two rows will be returned.
- b. Four rows will be returned.
- c. Only Fred 05-Jan-1988 and Lizzie 10-Nov-1987 will be returned.

- d. No rows will be returned.

Solution : D) no rows will be returned.

5. Global Fast Foods has decided to give all staff members a 5% raise. Prepare a report that presents the output as shown in the chart.

EMPLOYEE LAST NAME	CURRENT SALARY	SALARY WITH 5% RAISE

Query –

Select last_name, salary, salary, round(salary * 0.05,2) As “SALARY WITH 5% RAISE” from f-staffs;

6. Create a query that will return the structure of the Oracle database EMPLOYEES table. Which columns are marked “nullable”? What does this mean?

Query -

Desc employee;

First_name, last_name, salary etc are nullable as they do not have primary key or not null.

7. The owners of DJs on Demand would like a report of all items in their D_CDs table with the following column headings: Inventory Item, CD Title, Music Producer, and Year Purchased. Prepare this report.

Query -

Select inventory_items, cd_title, procedure,year from D-CDS;

8. True/False – The following SELECT statement executes successfully:

SELECT last_name, job_id, salary AS Sal FROM employees;

Solution : True

9. True/False – The following SELECT statement executes successfully:

SELECT * FROM job_grades;

Solution : True

10. There are four coding errors in this statement. Can you identify them?

```
SELECT employee_id, last_name sal x 12 ANNUAL SALARY FROM employees;
```

Query-

```
Select employee_id, last_name, sal*12 as "Annual salary" from employees;
```

11. In the arithmetic expression salary*12 - 400, which operation will be evaluated first?

Solution : Multiplication

12. Which of the following can be used in the SELECT statement to return all columns of data in the Global Fast Foods f_staffs table?

- a. column names
- b. *
- c. DISTINCT id
- d. both a and b

Solution : b) *

13. Using SQL to choose the columns in a table uses which capability?

- a. selection
- b. projection
- c. partitioning
- d. join

Solution : a) selection

14. SELECT last_name AS "Employee". The column heading in the query result will appear as:

- a. EMPLOYEE
- b. employee
- c. Employee
- d. "Employee:

Solution : c) Employee

15. Which expression below will produce the largest value?

- a. SELECT salary*6 + 100

- b. SELECT salary* (6 + 100)
- c. SELECT 6(salary+ 100)
- d. SELECT salary+6*100

Solution : b) SELECT salary* (6 + 100)

16. Which statement below will return a list of employees in the following format?

Mr./Ms. Steven King is an employee of our company.

- a. SELECT "Mr./Ms."||first_name||" "||last_name 'is an employee of our company.' AS "Employees"
FROM employees;
- b. SELECT 'Mr./Ms. 'first_name, last_name ||' ''is an employee of our company.' FROM
employees;
- c. SELECT 'Mr./Ms. "first_name||" "||last_name ||" "||'is an employee of our company.' AS
"Employees" FROM employees ;
- d. SELECT Mr./Ms. ||first_name|| " "||last_name ||" "||'is an employee of our company.' AS
"Employees" FROM employees

**Solution : c) SELECT 'Mr./Ms. "first_name||" "||last_name ||" "||'is an employee of our company.'
AS "Employees" FROM employees ;**

17. Which is true about SQL statements?

- a. SQL statements are case-sensitive
- b. SQL clauses should not be written on separate lines.
- c. Keywords cannot be abbreviated or split across lines.
- d. SQL keywords are typically entered in lowercase; all other words in uppercase.

Solution : c) Keywords cannot be abbreviated or split across lines.

18. Which queries will return three columns each with UPPERCASE column headings?

- a. SELECT "Department_id", "Last_name",
"First_name" FROM employees;
- b. SELECT DEPARTMENT_ID, LAST_NAME,
FIRST_NAME FROM employees;
- c. SELECT department_id, last_name, first_name AS UPPER

CASE FROM employees

- d. SELECT department_id, last_name,
first_name FROM employees;

Solution : b) SELECT DEPARTMENT_ID,

LAST_NAME, FIRST_NAME FROM employees;

19. Which statement below will likely fail?

- a. SELCT * FROM employees;
- b. Select * FROM employees;
- c. SELECT * FROM EMPLOYEES;
- d. SelecT* FROM employees;

Solution : d) SelecT* FROM employees;

20. Click on the History link at the bottom of the SQL Commands window. Scroll or use the arrows at the bottom of the page to find the statement you wrote to solve problem 3 above. (The one with the column heading SuperStar). Click on the statement to load it back into the command window. Execute the command again, just to make sure it is the correct one that works. Once you know it works, click on the SAVE button in the top right corner of the SQL Commands window, and enter a name for your saved statement. Use your own initials and “_superstar.sql”, so if your initials are CT then the filename will be CT_superstar.sql.

Log out of OAE, and log in again immediately. Navigate back to the SQL Commands window, click the Saved SQL link at the bottom of the page and load your saved SQL statement into the Edit window. This is done by clicking on the script name. Edit the statement, to make it display + instead of *. Run your amended statement and save it as initials_superuser.sql.

INCLUDING CONSTRAINTS

OBJECTIVE

After the completion of this exercise the students should be able to do the following

- Describe the constraints
- Create and maintain the constraints

What are Integrity constraints?

- Constraints enforce rules at the table level.
- Constraints prevent the deletion of a table if there are dependencies

The following types of integrity constraints are valid

a) **Domain Integrity**

- ✓ NOT NULL
- ✓ CHECK

b) **Entity Integrity**

- ✓ UNIQUE
- ✓ PRIMARY KEY

c) **Referential Integrity**

- ✓ FOREIGN KEY

Constraints can be created in either of two ways

1. At the same time as the table is created
2. After the table has been created.

3. **Defining Constraints**

Create table tablename (column_name1 data_type constraints, column_name2 data_type constraints ...);

Example:

Create table employees (employee_id number(6), first_name varchar2(20), ..job_id varchar2(10), CONSTRAINT emp_emp_id_pk PRIMARY KEY (employee_id));

Domain Integrity

This constraint sets a range and any violations that takes place will prevent the user from performing the manipulation that caused the breach. It includes:

NOT NULL Constraint

While creating tables, by default the rows can have null value. The enforcement of not null constraint in a table ensure that the table contains values.

Principle of null values:

- Setting null value is appropriate when the actual value is unknown, or when a value would not be meaningful.
- A null value is not equivalent to a value of zero.
- A null value will always evaluate to null in any expression.
- When a column name is defined as not null, that column becomes a mandatory i.e., the user has to enter data into it.
- Not null Integrity constraint cannot be defined using the alter table command when the table contain rows.

Example

CREATE TABLE employees (employee_id number (6), last_name varchar2(25) NOT NULL, salary number(8,2), commission_pct number(2,2), hire_date date constraint emp_hire_date_nn NOT NULL'....);

CHECK

Check constraint can be defined to allow only a particular range of values. When the manipulation violates this constraint, the record will be rejected. Check condition cannot contain sub queries.

```
CREATE TABLE employees (employee_id number (6), last_name varchar2 (25) NOT NULL,  
salary number(8,2), commission_pct number(2,2), hire_date date constraint emp_hire_date_nn  
NOT NULL'...,CONSTRAINT emp_salary_mi CHECK(salary > 0));
```

Entity Integrity

Maintains uniqueness in a record. An entity represents a table and each row of a table represents an instance of that entity. To identify each row in a table uniquely we need to use this constraint. There are 2 entity constraints:

a) Unique key constraint

It is used to ensure that information in the column for each record is unique, as with telephone or driver's license numbers. It prevents the duplication of value with rows of a specified column in a set of column. A column defined with the constraint can allow null value.

If unique key constraint is defined in more than one column i.e., combination of column cannot be specified. Maximum combination of columns that a composite unique key can contain is 16.

Example:

```
CREATE TABLE employees (employee_id number(6), last_name varchar2(25) NOT  
NULL,email varchar2(25), salary number(8,2), commission_pct number(2,2), hire_date date  
constraint emp_hire_date_nn NOT NULL' COSTRAINT emp_email_uk UNIQUE(email));
```

PRIMARY KEY CONSTRAINT

A primary key avoids duplication of rows and does not allow null values. Can be defined on one or more columns in a table and is used to uniquely identify each row in a table. These values should never be changed and should never be null.

A table should have only one primary key. If a primary key constraint is assigned to more than one column or combination of column is said to be composite primary key, which can contain 16 columns.

Example:

```
CREATE TABLE employees (employee_id number(6) , last_name varchar2(25) NOT NULL,email varchar2(25), salary number(8,2), commission_pct number(2,2), hire_date date constraint emp_hire_date_nn NOT NULL, Constraint emp_id_pk PRIMARY KEY (employee_id),CONSTRAINT emp_email_uk UNIQUE(email));
```

c) Referential Integrity

It enforces relationship between tables. To establish parent-child relationship between 2 tables having a common column definition, we make use of this constraint. To implement this, we should define the column in the parent table as primary key and same column in the child table as foreign key referring to the corresponding parent entry.

Foreign key

A column or combination of column included in the definition of referential integrity, which would refer to a referenced key.

Referenced key

It is a unique or primary key upon which is defined on a column belonging to the parent table.

Keywords:

FOREIGN KEY: Defines the column in the child table at the table level constraint.

REFERENCES: Identifies the table and column in the parent table.

ON DELETE CASCADE: Deletes the dependent rows in the child table when a row in the parent table is deleted.

ON DELETE SET NULL: converts dependent foreign key values to null when the parent value is removed.

```
CREATE TABLE employees (employee_id number(6), last_name varchar2(25) NOT NULL,email varchar2(25), salary number(8,2), commission_pct number(2,2), hire_date date constraint emp_hire_date_nn NOT NULL, Constraint emp_id_pk PRIMARY KEY (employee_id),CONSTRAINT emp_email_uk UNIQUE(email),CONSTRAINT emp_dept_fk FOREIGN KEY (department_id) references departments(dept_id));
```

ADDING A CONSTRAINT

Use the ALTER to

- Add or Drop a constraint, but not modify the structure
- Enable or Disable the constraints
- Add a not null constraint by using the Modify clause

Syntax

```
ALTER TABLE table name ADD CONSTRAINT Cons_name type(column name);
```

Example:

```
ALTER TABLE employees ADD CONSTRAINT emp_manager_fk FOREIGN KEY (manager_id) REFERENCES employees (employee_id);
```

DROPPING A CONSTRAINT

Example:

```
ALTER TABLE employees DROP CONSTRAINT emp_manager_fk;
```

CASCADE IN DROP

- The CASCADE option of the DROP clause causes any dependent constraints also to be dropped.

Syntax

```
ALTER TABLE departments DROP PRIMARY KEY|UNIQUE (column)| CONSTRAINT  
constraint _name CASCADE;
```

DISABLING CONSTRAINTS

- Execute the DISABLE clause of the ALTER TABLE statement to deactivate an integrity constraint
- Apply the CASCADE option to disable dependent integrity constraints.

Example

```
ALTER TABLE employees DISABLE CONSTRAINT emp_emp_id_pk CASCADE;
```

ENABLING CONSTRAINTS

- Activate an integrity constraint currently disabled in the table definition by using the ENABLE clause.

Example

```
ALTER TABLE employees ENABLE CONSTRAINT emp_emp_id_pk CASCADE;
```

CASCADING CONSTRAINTS

The CASCADE CONSTRAINTS clause is used along with the DROP column clause. It drops all referential integrity constraints that refer to the primary and unique keys defined on the dropped Columns.

This clause also drops all multicolumn constraints defined on the dropped column.

Example:

Assume table TEST1 with the following structure

```
CREATE TABLE test1 ( pk number PRIMARY KEY, fk number, col1 number,col2 number,
CONSTRAINT fk_constraint FOREIGN KEY(fk) references test1, CONSTRAINT ck1 CHECK
(pk>0 and col1>0), CONSTRAINT ck2 CHECK (col2>0));
```

An error is returned for the following statements

```
ALTER TABLE test1 DROP (pk);
ALTER TABLE test1 DROP (col1);
```

The above statement can be written with CASCADE CONSTRAINT

```
ALTER TABLE test1 DROP(pk) CASCADE CONSTRAINTS;
```

(OR)

```
ALTER TABLE test1 DROP(pk, fk, col1) CASCADE CONSTRAINTS;
```

VIEWING CONSTRAINTS

Query the USER_CONSTRAINTS table to view all the constraints definition and names.

Example:

```
SELECT constraint_name, constraint_type, search_condition FROM user_constraints
WHERE table_name='employees';
```

Viewing the columns associated with constraints

```
SELECT constraint_name, constraint_type, FROM user_cons_columns
WHERE table_name='employees';
```

Find the Solution for the following:

1. Add a table-level PRIMARY KEY constraint to the EMP table on the ID column. The constraint should be named at creation. Name the constraint my_emp_id_pk.

Query – create table EMP (EMP_ID number (10)), constraint my_emp_id_pk primary key (EMPID));

2. Create a PRIMAY KEY constraint to the DEPT table using the ID colum. The constraint should be named at creation. Name the constraint my_dept_id_pk.

Query – create table DEPT (DEPT_ID number (10), constraint my_dept_id_pk primary key (Dept_id));

3. Add a column DEPT_ID to the EMP table. Add a foreign key reference on the EMP table that ensures that the employee is not assigned to nonexistent department. Name the constraint my_emp_dept_id_fk.

Query – Alter table EMP add (Dept_id)

Alter table EMP add constraint my_emp_dept_id_fk

Foreign key (Dept_id) references dept (Dept_id));

4. Modify the EMP table. Add a COMMISSION column of NUMBER data type, precision 2, scale 2. Add a constraint to the commission column that ensures that a commission value is greater than zero.

P Abhignya - 221701002

Writing Basic SQL SELECT Statements

OBJECTIVES

After the completion of this exercise, the students will be able to do the following:

- List the capabilities of SQL SELECT Statement
- Execute a basic SELECT statement

Capabilities of SQL SELECT statement

A SELECT statement retrieves information from the database. Using a select statement, we can perform

- ✓ Projection: To choose the columns in a table
- ✓ Selection: To choose the rows in a table
- ✓ Joining: To bring together the data that is stored in different tables

Basic SELECT Statement

Syntax

```
SELECT *|DISTINCT Column_name| alias  
      FROM table_name;
```

NOTE:

DISTINCT—Suppr

ess the duplicates.

Alias—gives selected columns different headings.

Example: 1

```
SELECT * FROM departments;
```

Example: 2

```
SELECT location_id, department_id FROM departments;
```

Writing SQL Statements

- SQL statements are not case sensitive
- SQL statements can be on one or more lines.
- Keywords cannot be abbreviated or split across lines
- Clauses are usually placed on separate lines
- Indents are used to enhance readability

Using Arithmetic Expressions

Basic Arithmetic operators like *, /, +, - can be used

Example:1

```
SELECT last_name, salary, salary+300 FROM employees;
```

Example:2

```
SELECT last_name, salary, 12*salary+100 FROM employees;
```

The statement is not same as

```
SELECT last_name, salary, 12*(salary+100) FROM employees;
```

Example:3

```
SELECT last_name, job_id, salary, commission_pct FROM employees;
```

Example:4

```
SELECT last_name, job_id, salary, 12*salary*commission_pct FROM employees;
```

Using Column Alias

- To rename a column heading with or without AS keyword.

Example:1

```
SELECT last_name AS Name  
FROM employees;
```

Example: 2

```
SELECT last_name "Name" salary*12 "Annual Salary"  
FROM employees;
```

Concatenation Operator

- Concatenates columns or character strings to other columns
- Represented by two vertical bars (||)
- Creates a resultant column that is a character expression

Example:

```
SELECT last_name||job_id AS "EMPLOYEES JOB" FROM employees;
```

Using Literal Character String

- A literal is a character, a number, or a date included in the SELECT list.
- Date and character literal values must be enclosed within single quotation marks.

Example:

```
SELECT last_name||'is a'||job_id AS "EMPLOYEES JOB" FROM employees;
```

Eliminating Duplicate Rows

- Using DISTINCT keyword.

Example:

```
SELECT DISTINCT department_id FROM employees;
```

Displaying Table Structure

- Using DESC keyword.

Syntax

```
DESC table_name;
```

Find the Solution for the following:

True OR False

1. The following statement executes successfully.

Identify the Errors

SELECT employee_id, last_name sal*12 ANNUAL SALARY FROM employees;

Query – select employee_id, last_name, sal*12 as annual_salary from employees;

2. Show the structure of departments the table. Select all the data from it.

Query – desc departments;

Select * from departments;

3. Create a query to display the last name, job code, hire date, and employee number for each employee, with employee number appearing first.

Query – select employee_id as employee_number, last_name, job_code, hire_date from employee;

4. Provide an alias STARTDATE for the hire date.

Query – select hire_date as start_date from employee;

5. Create a query to display unique job codes from the employee table.

Query – select distinct job_code from employee;

6. Display the last name concatenated with the job ID , separated by a comma and space, and name the column EMPLOYEE and TITLE.

Query – select concat (last_name, ‘ , ‘ , job_id) as “employee” and “title” from employee ;

7. Create a query to display all the data from the employees table. Separate each column by a comma. Name the column THE_OUTPUT.

Query - select employee_id || ‘ , ‘ || first_name || ‘ , ‘ || last_name || ‘ , ‘ || job_code || ‘ , ‘ || hire_date as the_output from employees;

Ex. No. : **P-2**

Date:

Register No.: **221701002**

Name: **P Abhignya**

COMPARISON OPERATORS

1. Who are the partners of DJs on Demand who do not get an authorized expense amount?

Query – select * from d-partners where auth_expens_amt is null;

2. Select all the Oracle database employees whose last names end with “s”. Change the heading of the column to read Possible Candidates.

Query – select * as “Possible Candidates” from employees where select last_name as “Possible Candidates” from employees where substr (last_name,-1) =’s’ ;

3. Which statement(s) are valid?

- a. WHERE quantity <> NULL;
- b. WHERE quantity = NULL;
- c. WHERE quantity IS NULL;
- d. WHERE quantity != NULL;

Solution : c) SelecT* FROM employees;

4. Write a SQL statement that lists the songs in the DJs on Demand inventory that are type code 77, 12, or 1.

Query – select title from d-songs where type_code in (77,12,1);

Logical Comparisons and Precedence Rules

1. Execute the two queries below. Why do these nearly identical statements produce two different results? Name the difference and explain why.

```
SELECT code, description
```

```
FROM d_themes
```

```
WHERE code >200 AND description IN('Tropical', 'Football', 'Carnival');
```

```
SELECT code, description
```

```
FROM d_themes
```

```
WHERE code >200 OR description IN('Tropical', 'Football', 'Carnival');
```

Solution : These two queries are different because of the use of AND and OR between two conditions. In 1st query when both conditions were satisfied record will be displayed. In 2nd query when any 1 condition is satisfied will be displayed.

2. Display the last names of all Global Fast Foods employees who have “e” and “i” in their last names.

Query – select last_name from f_staffs where last_name like ‘ % e% ’ and last_name like ‘ % i % ’;

3. “I need to know who the Global Fast Foods employees are that make more than \$6.50/hour and their position is not order taker.”

Query - select * from f-staffs where salary > 650 and staff_type != ‘order taker’;

4. Using the employees table, write a query to display all employees whose last names start with “D” and have “a” and “e” anywhere in their last name.

Query – select * from f-staffs where substr(last_name,1) = ‘D’ and last_name like ‘ % a % ’ and last_name like ‘ % e % ’ ;

5. In which venues did DJs on Demand have events that were not in private homes?

Query – select * from d-venue where lotype != ‘private home’;

6. Which list of operators is in the correct order from highest precedence to lowest precedence?

- a. AND, NOT, OR

- b. NOT, OR, AND
- c. NOT, AND, OR

Solution : c) NOT, AND, OR

For questions 7 and 8, write SQL statements that will produce the desired output.

7. Who am I?

I was hired by Oracle after May 1998 but before June of 1999. My salary is less than \$8000 per month, and I have an “en” in my last name.

Query – select first_name || ‘ ‘ || last_name from employee where hire_date > ‘4-30-1998’ and hire_date < ‘6-1-1998’ and salary < 8000 and last_name like ‘ % en % ’ ;

8. What's my email address?

Because I have been working for Oracle since the beginning of 1996, I make more than \$9000 per month. Because I make so much money, I don't get a commission

Query - select email from employees where extract (year from hire_date) = ‘1996’ and salary > 9000 and commission is null;

Ex. No. : **06**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Restricting and Sorting data

After the completion of this exercise, the students will be able to do the following:

- Limit the rows retrieved by the queries
- Sort the rows retrieved by the queries
-

Limiting the Rows selected

- Using WHERE clause
- Alias cannot used in WHERE clause

Syntax

SELECT-----

FROM-----

WHERE condition;

Example:

```
SELECT employee_id, last_name, job_id, department_id FROM employees WHERE  
department_id=90;
```

Character strings and Dates

Character strings and date values are enclosed in single quotation marks.

Character values are case sensitive and date values are format sensitive.

Example:

```
SELECT employee_id, last_name, job_id, department_id FROM employees  
WHERE last_name='WHALEN';
```

Comparison Conditions

All relational operators can be used. (=, >, >=, <, <=, <>, !=)

Example:

```
SELECT last_name, salary  
FROM employees  
WHERE salary<=3000;
```

Other comparison conditions

Operator	Meaning
BETWEEN ...AND...	Between two values
IN	Match any of a list of values
LIKE	Match a character pattern
IS NULL	Is a null values

Example:1

```
SELECT last_name, salary  
FROM employees
```

```
WHERE salary BETWEEN 2500 AND 3500;
```

Example:2

```
SELECT employee_id, last_name, salary , manager_id  
FROM employees  
WHERE manager_id IN (101, 100,201);
```

Example:3

- Use the LIKE condition to perform wildcard searches of valid string values.
- Two symbols can be used to construct the search string
- % denotes zero or more characters
- _ denotes one character

```
SELECT first_name, salary  
FROM employees  
WHERE first_name LIKE '%s';
```

Example:4

```
SELECT last_name, salary  
FROM employees  
WHERE last_name LIKE '_o%';
```

Example:5

ESCAPE option-To have an exact match for the actual % and _ characters
To search for the string that contain ‘SA_’

```
SELECT employee_id, first_name, salary, job_id
```

```
FROM employees  
WHERE job_id LIKE '%sa\_%'ESCAPE'\';
```

Test for NULL

- Using IS NULL operator

Example:

```
SELECT employee_id, last_name, salary , manager_id  
FROM employees  
WHERE manager_id IS NULL;
```

Logical Conditions

All logical operators can be used.(AND,OR,NOT)

Example:1

```
SELECT employee_id, last_name, salary , job_id  
FROM employees  
WHERE salary>=10000  
AND job_id LIKE '%MAN%';
```

Example:2

```
SELECT employee_id, last_name, salary , job_id  
FROM employees  
WHERE salary>=10000  
OR job_id LIKE '%MAN%';
```

Example:3

```
SELECT employee_id, last_name, salary , job_id  
FROM employees  
WHERE job_id NOT IN ('it_prog', st_clerk', sa_rep');
```

Rules of Precedence

Order Evaluated	Operator
1	Arithmetic
2	Concatenation
3	Comparison
4	IS [NOT] NULL, LIKE, [NOT] IN
5	[NOT] BETWEEN
6	Logical NOT
7	Logical AND
8	Logical OR

Example:1

```
SELECT employee_id, last_name, salary , job_id  
FROM employees  
WHERE job_id='sa_rep'  
OR job_id='ad_pres'  
AND salary>15000;
```

Example:2

```
SELECT employee_id, last_name, salary , job_id  
FROM employees  
WHERE (job_id ='sa_rep'  
OR job_id='ad_pres')  
AND salary>15000;
```

Sorting the rows

Using ORDER BY Clause

ASC-Ascending Order,Default

DESC-Descending order

Example:1

```
SELECT last_name, salary , job_id,department_id,hire_date  
FROM employees  
ORDER BY hire_date;
```

Example:2

```
SELECT last_name, salary , job_id,department_id,hire_date  
FROM employees  
ORDER BY hire_date DESC;
```

Example:3

Sorting by column alias

```
SELECT last_name, salary*12 annsal , job_id,department_id,hire_date  
FROM employees  
ORDER BY annsal;
```

Example:4

Sorting by Multiple columns

```
SELECT last_name, salary , job_id,department_id,hire_date  
FROM employees  
ORDER BY department_id, salary DESC;
```

Find the Solution for the following:

1. Create a query to display the last name and salary of employees earning more than 12000.

Query – select emp_name, salary from employees where salary > 12000

2. Create a query to display the employee last name and department number for employee number 176.

Query – select emp_name, dept_id from employee where emp_id = 176;

3. Create a query to display the last name and salary of employees whose salary is not in the range of 5000 and 12000. (hints: not between)

Query – select emp_name, salary from employee where salary <5000 and salary > 12000;

4. Display the employee last name, job ID, and start date of employees hired between February 20,1998 and May 1,1998.order the query in ascending order by start date.(hints: between)

Query – select emp_name, job_id, start_date from employee where start_date > '20-02-1998' and start_date < '1-05-1993' orderly start_date ASC;

5. Display the last name and department number of all employees in departments 20 and 50 in alphabetical order by name.(hints: in, orderby)

Query – select emp_name, dept_id from employees where dept_id = 20 or dept_id = 50 order by emp_name ASC;

6. Display the last name and salary of all employees who earn between 5000 and 12000 and are in departments 20 and 50 in alphabetical order by name. Label the columns EMPLOYEE, MONTHLY SALARY respectively.(hints: between, in)

Query – select emp_name, salary from employee where salary between 5000 and 12000 and dept_id =20 or dept_id order by emp_name ASC;

7. Display the last name and hire date of every employee who was hired in 1994.(hints: like)

Query - select emp_name, start_date from employee where start_date between '01-01-1994' and '31-12-1994' ;

8. Display the last name and job title of all employees who do not have a manager.(hints: is null)

Query – select emp_name, job_title from employee where manager is null;

9. Display the last name, salary, and commission for all employees who earn commissions.

Sort data in descending order of salary and commissions.(hints: is not null,orderby)

Query – select emp_name, salary, commission from employee where commission is not null;

10. Display the last name of all employees where the third letter of the name is *a*.(hints:like)

Query – select emp_name from employee where emp_name ‘_ _ a %’ ;

11. Display the last name of all employees who have an *a* and an *e* in their last name.(hints: like)

Query – select emp_name from employee where emp_name like ‘ % a % ’ and emp_name like ‘ % e % ’

12. Display the last name and job and salary for all employees whose job is sales representative or stock clerk and whose salary is not equal to 2500 ,3500 or 7000.(hints:in,not in)

Query - select emp_name, salary, commission from employee where commission = salary * 0.2;

13. Display the last name, salary, and commission for all employees whose commission amount is 20%.(hints:use predicate logic)

Query – select last_name, salary, commission from employee where commission = salary * 0.2;

Ex. No. : **P-3**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Sorting Rows

1. In the example below, assign the employee_id column the alias of “Number.” Complete the SQL statement to order the result set by the column alias.

SELECT employee_id, first_name, last_name **FROM** employees;

Query – select employee_id as “number”, first_name, last_name from employees order by “number”;

2. Create a query that will return all the DJs on Demand CD titles ordered by year with titles in alphabetical order by year.

Query – select title as “ our collection” from d_songs order by “our_collection”;

3. Order the DJs on Demand songs by descending title. Use the alias "Our Collection" for the song title.

Query - select * from table_name order by column_name;

4. Write a SQL statement using the ORDER BY clause that could retrieve the information needed.

Query - select title from d_cds order by title, year;

Ex. No. : **07**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Single Row Functions

Objective

After the completion of this exercise, the students will be able to do the following:

- Describe various types of functions available in SQL.
- Use character, number and date functions in SELECT statement.
- Describe the use of conversion functions.

Single row functions:

Manipulate data items.

Accept arguments and return one value.

Act on each row returned.

Return one result per row.

May modify the data type.

Can be nested.

Accept arguments which can be a column or an expression

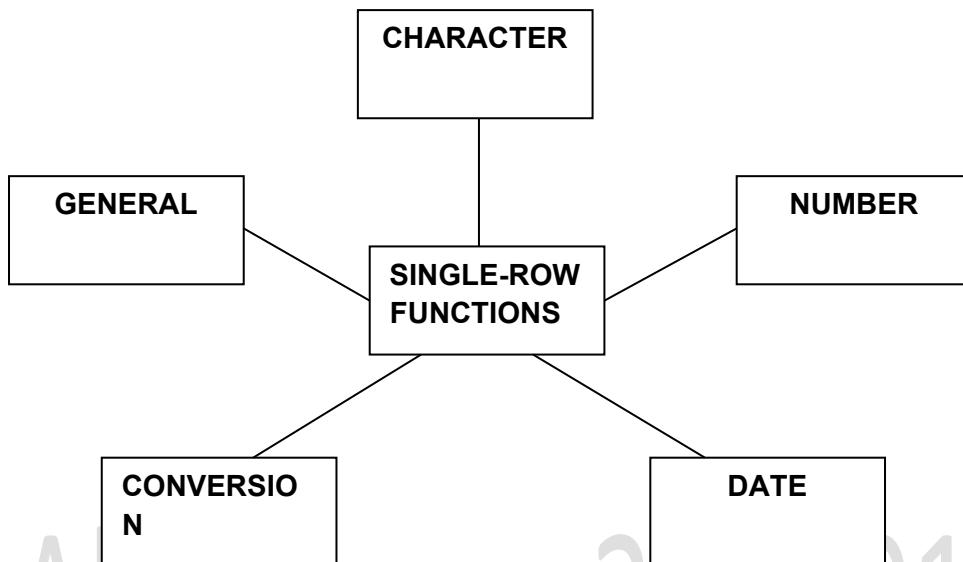

Syntax

Function_name(arg1,...argn)

An argument can be one of the following

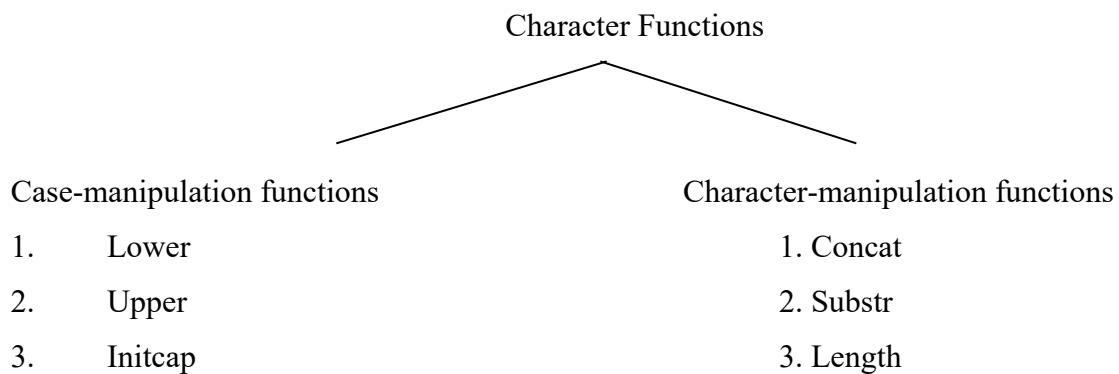

- ✓ User-supplied constant
- ✓ Variable value

- ✓ Column name
- ✓ Expression

- Character Functions: Accept character input and can return both character and number values.
- Number functions: Accept numeric input and return numeric values.
- Date Functions: Operate on values of the DATE data type.
- Conversion Functions: Convert a value from one type to another.

Character Functions

4. Instr
5. Lpad/Rpad
6. Trim
7. Repalce

Function	Purpose
lower(column(expr)	Converts alpha character values to lowercase
upper(column(expr)	Converts alpha character values to uppercase
initcap(column(expr)	Converts alpha character values the to uppercase for the first letter of each word, all other letters in lowercase
concat(column1/expr1, column2/expr2)	Concatenates the first character to the second character
substr(column/expr,m,n)	Returns specified characters from character value starting at character position m, n characters long
length(column/expr)	Returns the number of characters in the expression
instr(column/expr,'string',m,n)	Returns the numeric position of a named string
lpad(column/expr, n,'string')	Pads the character value right-justified to a total width of n character positions
rpad(column/expr, 'string' ,m,n)	Pads the character value left-justified to a total width of n character positions
trim(leading/trailing/both, trim_character FROM trim_source)	Enables you to trim heading or string. trailing or both from a character
replace(text, search_string, replacement_string)	

Example:

lower('SQL Course') → sql course

upper('SQL Course') → SQL COURSE

initcap('SQL Course') → Sql Course

SELECT 'The job id for' || upper(last_name) || 'is' || lower(job_id) AS "EMPLOYEE DETAILS"
FROM employees;

SELECT employee_id, last_name, department_id
FROM employees
WHERE LOWER(last_name)='higgins';

Function	Result
CONCAT('hello', 'world')	helloworld
Substr('helloworld',1,5)	Hello
Length('helloworld')	10
Instr('helloworld','w')	6
Lpad(salary,10,'*')	*****2400 0
Rpad(salary,10,'*')	24000**** *
Trim('h' FROM 'helloworld')	elloworld

Command	Query	Output
initcap(char);	select initcap("hello") from dual;	Hello

lower (char);	<i>select lower ('HELLO') from dual;</i>	Hello
upper (char);	<i>select upper ('hello') from dual;</i>	HELLO
ltrim (char,[set]);	<i>select ltrim ('cseit', 'cse') from dual;</i>	IT
rtrim (char,[set]);	<i>select rtrim ('cseit', 'it') from dual;</i>	CSE
replace (char,search string, replace string);	<i>select replace ('jack and jue', 'j', 'bl') from dual;</i>	black and blue
substr (char,m,n);	<i>select substr ('information', 3, 4) from dual;</i>	form

Example:

```
SELECT employee_id, CONCAT(first_name,last_name) NAME , job_id,LENGTH(last_name),
INSTR(last_name,'a') "contains'a'?"
FROM employees WHERE SUBSTR(job_id,4)= 'ERP';
```

NUMBER FUNCTIONS

Function	Purpose
round(column/expr, n)	Rounds the value to specified decimal
trunc(column/expr,n)	Truncates value to specified decimal
mod(m,n)	Returns remainder of division

Example

Function	Result
round(45.926,2)	45.93
trunc(45.926,2)	45.92
mod(1600,300)	100

SELECT ROUND(45.923,2), ROUND(45.923,0), ROUND(45.923,-1) FROM dual;

NOTE: Dual is a dummy table you can use to view results from functions and calculations.

SELECT TRUNC(45.923,2), TRUNC(45.923), TRUNC(45.923,-2) FROM dual;

SELECT last_name,salary,MOD(salary,5000) FROM employees WHERE job_id='sa_rep';

Working with Dates

The Oracle database stores dates in an internal numeric format: century, year, month, day, hours, minutes, and seconds.

- The default date display format is DD-MON-RR.
 - Enables you to store 21st-century dates in the 20th century by specifying only the last two digits of the year
 - Enables you to store 20th-century dates in the 21st century in the same way

Example

SELECT last_name, hire_date FROM employees WHERE hire_date < '01-FEB-88';

Working with Dates

SYSDATE is a function that returns:

- Date
- Time

Example

Display the current date using the DUAL table.

SELECT SYSDATE FROM DUAL;

Arithmetic with Dates

- Add or subtract a number to or from a date for a resultant date value.
- Subtract two dates to find the number of days between those dates.
- Add hours to a date by dividing the number of hours by 24.

Arithmetic with Dates

Because the database stores dates as numbers, you can perform calculations using arithmetic Operators such as addition and subtraction. You can add and subtract number constants as well as dates.

You can perform the following operations:

Operation	Result	Description
date + number	Date	Adds a number of days to a date
date - number	Date	Subtracts a number of days from a date
date - date	Number of days	Subtracts one date from another
date + number/24	Date	Adds a number of hours to a date

Example

```
SELECT last_name, (SYSDATE-hire_date)/7 AS WEEKS  
FROM employees  
WHERE department_id = 90;
```

Date Functions

Function	Result
MONTHS_BETWEEN	Number of months between two dates
ADD_MONTHS	Add calendar months to date
NEXT_DAY	Next day of the date specified
LAST_DAY	Last day of the month
ROUND	Round date
TRUNC	Truncate date

Date Functions

Date functions operate on Oracle dates. All date functions return a value of DATE data type except MONTHS_BETWEEN, which returns a numeric value.

- MONTHS_BETWEEN(date1, date2)::: Finds the number of months between date1 and date2. The result can be positive or negative. If date1 is later than date2, the result is positive; if date1 is earlier than date2, the result is negative. The noninteger part of the result represents a portion of the month.
- ADD_MONTHS(date, n)::: Adds n number of calendar months to date. The value of n must be an integer and can be negative.
- NEXT_DAY(date, 'char')::: Finds the date of the next specified day of the week ('char') following date. The value of char may be a number representing a day or a character string.
- LAST_DAY(date)::: Finds the date of the last day of the month that contains date
- ROUND(date[,fmt])::: Returns date rounded to the unit that is specified by the format model fmt. If the format model fmt is omitted, date is rounded to the nearest day.
- TRUNC(date[,fmt])::: Returns date with the time portion of the day truncated to the unit that is specified by the format model fmt. If the format model fmt is omitted, date is truncated to the nearest day.

Using Date Functions

Function	Result
MONTHS_BETWEEN ('01-SEP-95', '11-JAN-94')	19.6774194
ADD_MONTHS ('11-JAN-94', 6)	'11-JUL-94'
NEXT_DAY ('01-SEP-95', 'FRIDAY')	'08-SEP-95'
LAST_DAY ('01-FEB-95')	'28-FEB-95'

Example

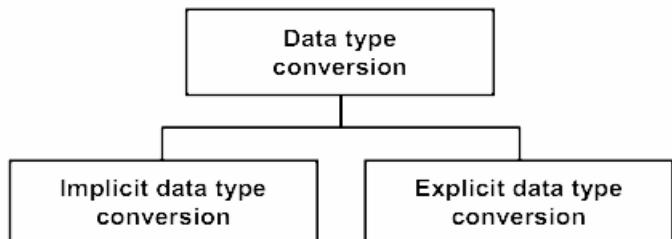

Display the employee number, hire date, number of months employed, sixmonth review date, first Friday after hire date, and last day of the hire month for all employees who have been employed for fewer than 70 months.

```
SELECT employee_id, hire_date, MONTHS_BETWEEN (SYSDATE, hire_date)
TENURE, ADD_MONTHS (hire_date, 6) REVIEW, NEXT_DAY (hire_date, 'FRIDAY'),
LAST_DAY(hire_date)
FROM employees
WHERE MONTHS_BETWEEN (SYSDATE, hire_date) < 70;
```

Conversion Functions

This covers the following topics:

- Writing a query that displays the current date
- Creating queries that require the use of numeric, character, and date functions
- Performing calculations of years and months of service for an employee

Implicit Data Type Conversion

For assignments, the Oracle server can automatically convert the following:

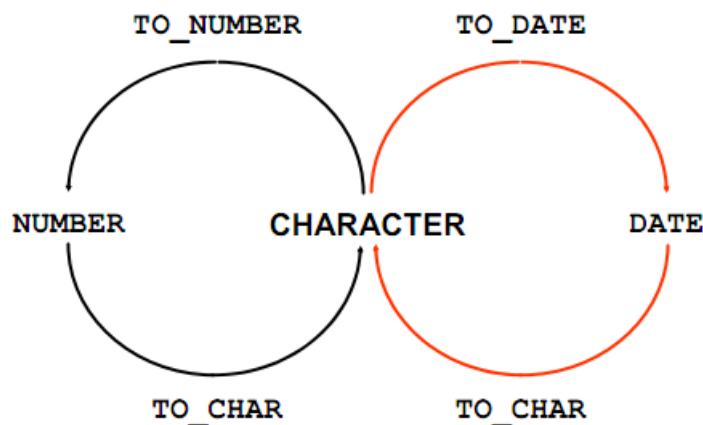

From	To
VARCHAR2 or CHAR	NUMBER
VARCHAR2 or CHAR	DATE
NUMBER	VARCHAR2
DATE	VARCHAR2

For example, the expression `hire_date > '01-JAN-90'` results in the implicit conversion from the string '01-JAN-90' to a date.

For expression evaluation, the Oracle Server can automatically convert the following:

From	To
VARCHAR2 or CHAR	NUMBER
VARCHAR2 or CHAR	DATE

Explicit Data Type Conversion

SQL provides three functions to convert a value from one data type to another:

Example:

Using the TO_CHAR Function with Dates

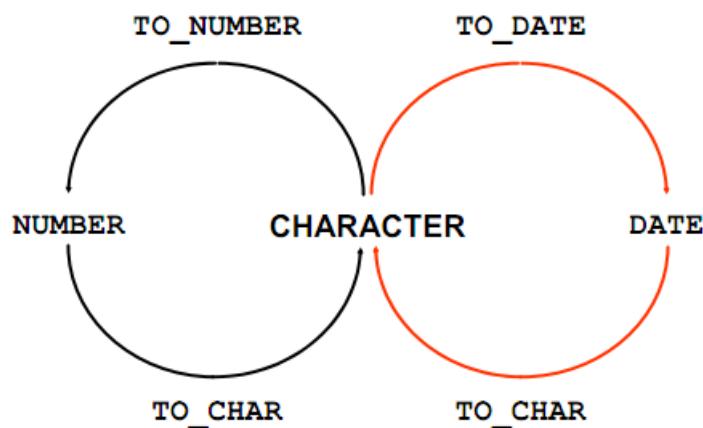

TO_CHAR(date, 'format_model')

The format model:

- Must be enclosed by single quotation marks
- Is case-sensitive
- Can include any valid date format element
- Has an fm element to remove padded blanks or suppress leading zeros
- Is separated from the date value by a comma

```
SELECT employee_id, TO_CHAR(hire_date, 'MM/YY') Month_Hired  
FROM employees WHERE last_name = 'Higgins';
```

Elements of the Date Format Model

Sample Format Elements of Valid Date

Element	Description
SCC or CC	Century; server prefixes B.C. date with -
Years in dates YYYY or SYYYY	Year; server prefixes B.C. date with -
YYY or YY or Y	Last three, two, or one digits of year
Y,YYY	Year with comma in this position
IYYY, IYY, IY, I	Four-, three-, two-, or one-digit year based on the ISO standard
SYEAR or YEAR	Year spelled out; server prefixes B.C. date with -
BC or AD	Indicates B.C. or A.D. year
B.C. or A.D.	Indicates B.C. or A.D. year using periods
Q	Quarter of year
MM	Month: two-digit value
MONTH	Name of month padded with blanks to length of nine characters
MON	Name of month, three-letter abbreviation
RM	Roman numeral month
WW or W	Week of year or month
DDD or DD or D	Day of year, month, or week
DAY	Name of day padded with blanks to a length of nine characters
DY	Name of day; three-letter abbreviation
J	Julian day; the number of days since December 31, 4713 B.C.

1002

Date Format Elements: Time Formats

Use the formats that are listed in the following tables to display time information and literals and to change numerals to spelled numbers.

Element	Description
AM or PM	Meridian indicator
A.M. or P.M.	Meridian indicator with periods
HH or HH12 or HH24	Hour of day, or hour (1–12), or hour (0–23)
MI	Minute (0–59)
SS	Second (0–59)
SSSS	Seconds past midnight (0–86399)

Other Formats

Element	Description
/ . ,	Punctuation is reproduced in the result.
"of the"	Quoted string is reproduced in the result.

Specifying Suffixes to Influence Number Display

Element	Description
TH	Ordinal number (for example, DDTH for 4TH)
SP	Spelled-out number (for example, DDSP for FOUR)
SPTH or THSP	Spelled-out ordinal numbers (for example, DDSPTH for FOURTH)

Example

```
SELECT last_name,  
TO_CHAR(hire_date, 'fmDD Month YYYY') AS HIREDATE  
FROM employees;
```

Modify example to display the dates in a format that appears as “Seventeenth of June 1987 12:00:00 AM.”

```
SELECT last_name,  
TO_CHAR (hire_date, 'fmDdspth "of" Month YYYY fmHH:MI:SS AM') HIREDATE  
FROM employees;
```

Using the TO_CHAR Function with Numbers

TO_CHAR(number, 'format_model')

These are some of the format elements that you can use with the TO_CHAR function to display a number value as a character:

Element	Result
9	Represents a number
0	Forces a zero to be displayed
\$	Places a floating dollar sign
L	Uses the floating local currency symbol
.	Prints a decimal point
,	Prints a comma as thousands indicator

Number Format Elements

If you are converting a number to the character data type, you can use the following format elements:

Element	Description	Example	Result
9	Numeric position (number of 9s determine display width)	999999	1234
0	Display leading zeros	099999	001234
\$	Floating dollar sign	\$999999	\$1234
L	Floating local currency symbol	L999999	FF1234
D	Returns in the specified position the decimal character. The default is a period (.).	99D99	99.99
.	Decimal point in position specified	999999.99	1234.00
G	Returns the group separator in the specified position. You can specify multiple group separators in a number format model.	9,999	9G999
,	Comma in position specified	999,999	1,234
M	Minus signs to right (negative values)	999999M	1234-
P	Parenthesize negative numbers	999999P	<1234>
E	Scientific notation (format must specify four Es)	99.999E	1.234E+03
U	Returns in the specified position the "Euro" (or other) dual currency	U9999	€1234
V	Multiply by 10 <i>n</i> times (<i>n</i> = number of 9s after V)	9999V99	123400
S	Returns the negative or positive value	\$9999	-1234 or +1234
B	Display zero values as blank, not 0	B9999.99	1234.00

```
SELECT TO_CHAR(salary, '$99,999.00') SALARY
```

```
FROM employees
```

```
WHERE last_name = 'Ernst';
```

Using the TO_NUMBER and TO_DATE Functions

- Convert a character string to a number format using the TO_NUMBER function:

TO_NUMBER(char[, 'format_model'])

- Convert a character string to a date format using the TO_DATE function:

TO_DATE(char[, 'format_model'])

- These functions have an fx modifier. This modifier specifies the exact matching for the character

argument and date format model of a TO_DATE function.

The fx modifier specifies exact matching for the character argument and date format model of a TO_DATE function:

- Punctuation and quoted text in the character argument must exactly match (except for case) the corresponding parts of the format model.
- The character argument cannot have extra blanks. Without fx, Oracle ignores extra blanks.
- Numeric data in the character argument must have the same number of digits as the corresponding element in the format model. Without fx, numbers in the character argument can omit leading zeros.

SELECT last_name, hire_date

FROM employees

WHERE hire_date = TO_DATE('May 24, 1999', 'fxMonth DD, YYYY');

Find the Solution for the following:

1. Write a query to display the current date. Label the column Date.

Query – select sysdate from dual;

2. The HR department needs a report to display the employee number, last name, salary, and increased by 15.5% (expressed as a whole number) for each employee. Label the column New Salary.

Query – select employee_id, last_name, salary and round (salary * 15.5) as “Salary” from employees;

3. Modify your query lab_03_02.sql to add a column that subtracts the old salary from the new salary. Label the column Increase.

Query - select round (new_salary_salary) as “Increased” from employees;

4. Write a query that displays the last name (with the first letter uppercase and all other letters lowercase) and the length of the last name for all employees whose name starts with the letters J, A, or M. Give each column an appropriate label. Sort the results by the employees’ last names.

Query – select initcap (last_name) as ‘Last Name’ , length (last_name) as “Length” from employees where substr (last_name,1,1) in (‘A’, ‘J’, ‘M’);

5. Rewrite the query so that the user is prompted to enter a letter that starts the last name. For example, if the user enters H when prompted for a letter, then the output should show all employees whose last name starts with the letter H.

Query – select initcap (last_name) as “Last_Name”, length (last_name) as “Length” from employees where substr (last_name,1,1) : x ;

6. The HR department wants to find the length of employment for each employee. For each employee, display the last name and calculate the number of months between today and the date on which the employee was hired. Label the column MONTHS_WORKED. Order your results by the number of months employed. Round the number of months up to the closest whole number.

Query – select last_name, round (months_between (sysdate, hiredate), 0) as “months_worked” from employees order by 2;

7. Create a report that produces the following for each employee:

<employee last name> earns <salary> monthly but wants <3 times salary>. Label the column Dream Salaries.

Query – select last_name || ‘ earns ‘ || salary || ‘ monthly but wants ‘ || salary * 3 “Dream salaries” from employees;

8. Create a query to display the last name and salary for all employees. Format the salary to be 15 characters long, left-padded with the \$ symbol. Label the column SALARY.

Query - select last_name, l_pad (salary,) salary from employees;

9. Display each employee’s last name, hire date, and salary review date, which is the first Monday after six months of service. Label the column REVIEW. Format the dates to appear in the format similar to “Monday, the Thirty-First of July, 2000.”

Query – select last_name, hire_date, to_char (next_day (add_month (hire_date, 6), ‘Monday’), ‘Friday’ , ‘the’ dsspth “of” month, 4444) review from employees;

10. Display the last name, hire date, and day of the week on which the employee started. Label the column DAY. Order the results by the day of the week, starting with Monday.

Query – select last_name, hire_date, to_char (hire_date, ‘Friday’) day from employees order by to_char (hire_day, ‘d’);

Ex. No. : **P-4**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Introduction to Functions

1. For each task, choose whether a single-row or multiple row function would be most appropriate:

- a. Showing all of the email addresses in upper case letters

Solution : single row

- b. Determining the average salary for the employees in the sales department

Solution : multi row

- c. Showing hire dates with the month spelled out (*September 1, 2004*)

Solution : single row

- d. Finding out the employees in each department that had the most seniority (the earliest hire date)

Solution : multi row

- e. Displaying the employees' salaries rounded to the hundreds place

Solution : single row

- f. Substituting zeros for null values when displaying employee commissions.

Solution : single row

2. The most common multiple-row functions are: AVG, COUNT, MAX, MIN, and SUM. Give your own definition for each of these functions.

Solution:

AVG – give average value of a single column in a table

Count – give count of no. of rows in a column

Max – gives max value of row data

Min – gives min value of row data

Sum – gives sum value of a single column in a table

3. Test your definitions by substituting each of the multiple-row functions in this query.

```
SELECT FUNCTION(salary)
```

```
FROM employees
```

Write out each query and its results.

Solution :

Select avg (salary) from employees 10392.85

Select count (salary) from employees 14

Select max (salary) from employees 20000

Select min (salary) from employees 3500

Select sum (salary) from employees 145500

P Abhignya - 221701002

Case and Character Manipulation

1. Using the three separate words “Oracle,” “Internet,” and “Academy,” use one command to produce the following output:

The Best Class Oracle Internet Academy

Query – select ‘Oracle’ || ‘Internet’ || ‘Academy’ “The Best class” from dual;

2. Use the string “Oracle Internet Academy” to produce the following output:

The Net net

Query – select substr(“Oracle Internet Academy”, 13.3) “The Net” from the dual;

3. What is the length of the string “Oracle Internet Academy”?

Query – select length (“Oracle Internet Academy”) from dual;

4. What’s the position of “I” in “Oracle Internet Academy”?

Query - select instr (“Oracle Internet Academy”, “I”) from dual;

5. Starting with the string “Oracle Internet Academy”, pad the string to create

****Oracle****Internet****Academy***

Query – select replace (rpad (lpad(“Oracle Internet Academy”, ‘*’, 27), ‘*’, 31), ‘ ’, ‘****’)
from dual;

Number Functions

1. Display Oracle database employee last_name and salary for employee_ids between 100 and 102.
- Include a third column that divides each salary by 1.55 and rounds the result to two decimal places.

Query – select last_name, salary, round (salary / 1.55,2) from employees where employee_id between 100 and 102;

2. Display employee last_name and salary for those employees who work in department 80. Give each of them a raise of 5.333% and truncate the result to two decimal places.

Query - select last_name, round (salary * 1.05333,2) “salary” from employee where department_id=80;

3. Use a MOD number function to determine whether 38873 is an even number or an odd number.

Query – select case mod (38873,2) = 1 then ‘odd’ else ‘even’ End from dual;

4. Use the DUAL table to process the following numbers:

845.553 - round to one decimal place

Query – select round (845.553,1) from dual;

30695.348 - round to two decimal places

Query – select round (30695.348,2) from dual;

30695.348 - round to -2 decimal Places

Query – select round (30695.348,-2) from dual;

2.3454 - truncate the .454 from the decimal place

Query – select round (2.3454,1) from dual;

5. Divide each employee’s salary by 3. Display only those employees’ last names and salaries who earn a salary that is a multiple of 3.

Query - select last_name, salary/3 “salary” from employees where mod (‘salary’,3) = 0;

6. Divide 34 by 8. Show only the remainder of the division. Name the output as EXAMPLE.

Query - select mod (34,8) from dual;

7. How would you like your paycheck – rounded or truncated? What if your paycheck was calculated to be \$565.784 for the week, but you noticed that it was issued for \$565.78. The loss of .004 cent would probably make very little difference to you. However, what if this was done to a thousand people, a 100,000 people, or a million people! Would it make a difference then? How much difference?

Query – select (565.784 – round (565.784,2) ‘1000’ c:x) as diff from dual

Displaying data from multiple tables

Objective

After the completion of this exercise, the students will be able to do the following:

- Write SELECT statements to access data from more than one table using equality and nonequality joins
- View data that generally does not meet a join condition by using outer joins
- Join a table to itself by using a self join

Sometimes you need to use data from more than one table.

Cartesian Products

- A Cartesian product is formed when:
 - A join condition is omitted
 - A join condition is invalid
 - All rows in the first table are joined to all rows in the second table
- To avoid a Cartesian product, always include a valid join condition in a WHERE clause.

A Cartesian product tends to generate a large number of rows, and the result is rarely useful. You should always include a valid join condition in a WHERE clause, unless you have a specific need to combine all rows from all tables.

Cartesian products are useful for some tests when you need to generate a large number of rows to simulate a reasonable amount of data.

Example:

To displays employee last name and department name from the EMPLOYEES and DEPARTMENTS tables.

```
SELECT last_name, department_name dept_name  
FROM employees, departments;
```

Types of Joins

- Equijoin
- Non-equijoin
- Outer join
- Self join
- Cross joins
- Natural joins
- Using clause
- Full or two sided outer joins
- Arbitrary join conditions for outer joins

Joining Tables Using Oracle Syntax

SELECT table1.column, table2.column

FROM table1, table2

WHERE table1.column1 = table2.column2;

Write the join condition in the WHERE clause.

- Prefix the column name with the table name when the same column name appears in more than one table.

Guidelines

- When writing a SELECT statement that joins tables, precede the column name with the table name for clarity and to enhance database access.
- If the same column name appears in more than one table, the column name must be prefixed with the table name.
- To join n tables together, you need a minimum of n-1 join conditions. For example, to join four tables, a minimum of three joins is required. This rule may not apply if your table has a concatenated primary key, in which case more than one column is required to uniquely identify each row

What is an Equijoin?

To determine an employee's department name, you compare the value in the DEPARTMENT_ID column in the EMPLOYEES table with the DEPARTMENT_ID values in the DEPARTMENTS table.

The relationship between the EMPLOYEES and DEPARTMENTS tables is an equijoin—that is, values

in the DEPARTMENT_ID column on both tables must be equal. Frequently, this type of join involves

primary and foreign key complements.

Note: Equijoins are also called simple joins or inner joins

```
SELECT employees.employee_id, employees.last_name, employees.department_id,  
departments.department_id, departments.location_id  
FROM employees, departments  
WHERE employees.department_id = departments.department_id;
```

Additional Search Conditions

Using the AND Operator

Example:

To display employee Matos' department number and department name, you need an additional condition in the WHERE clause.

```
SELECT last_name, employees.department_id,  
department_name  
FROM employees, departments  
WHERE employees.department_id = departments.department_id AND last_name = 'Matos';
```

Qualifying Ambiguous

Column Names

- Use table prefixes to qualify column names that are in multiple tables.
- Improve performance by using table prefixes.

- Distinguish columns that have identical names but reside in different tables by using column aliases.

Using Table Aliases

- Simplify queries by using table aliases.
- Improve performance by using table prefixes

Example:

```
SELECT e.employee_id, e.last_name, e.department_id,
d.department_id, d.location_id
FROM employees e , departments d
WHERE e.department_id = d.department_id;
```

Joining More than Two Tables

To join n tables together, you need a minimum of n-1 join conditions. For example, to join three tables, a minimum of two joins is required.

Example:

To display the last name, the department name, and the city for each employee, you have to join the EMPLOYEES, DEPARTMENTS, and LOCATIONS tables.

```
SELECT e.last_name, d.department_name, l.city
FROM employees e, departments d, locations l
WHERE e.department_id = d.department_id
AND d.location_id = l.location_id;
```

Non-Equijoins

A non-equijoin is a join condition containing something other than an equality operator. The relationship between the EMPLOYEES table and the JOB_GRADES table has an example of a non-equijoin. A relationship between the two tables is that the SALARY column in the

EMPLOYEES table must be between the values in the LOWEST_SALARY and HIGHEST_SALARY columns of the JOB_GRADES table. The relationship is obtained using an operator other than equals (=).

Example:

```
SELECT e.last_name, e.salary, j.grade_level  
FROM employees e, job_grades j  
WHERE e.salary  
BETWEEN j.lowest_sal AND j.highest_sal;
```

Outer Joins

Syntax

- You use an outer join to also see rows that do not meet the join condition.
- The Outer join operator is the plus sign (+).

```
SELECT table1.column, table2.column
```

```
FROM table1, table2
```

```
WHERE table1.column(+) = table2.column;
```

```
SELECT table1.column, table2.column
```

```
FROM table1, table2
```

```
WHERE table1.column = table2.column(+);
```

The missing rows can be returned if an outer join operator is used in the join condition. The operator

is a plus sign enclosed in parentheses (+), and it is placed on the “side” of the join that is deficient in

information. This operator has the effect of creating one or more null rows, to which one or more rows

from the nondeficient table can be joined.

Example:

```
SELECT e.last_name, e.department_id, d.department_name  
FROM employees e, departments d  
WHERE e.department_id(+) = d.department_id ;
```

Outer Join Restrictions

- The outer join operator can appear on only one side of the expression—the side that has information missing. It returns those rows from one table that have no direct match in the other table.
- A condition involving an outer join cannot use the IN operator or be linked to another condition by the OR operator

Self Join

Sometimes you need to join a table to itself.

Example:

To find the name of each employee's manager, you need to join the EMPLOYEES table to itself, or perform a self join.

```
SELECT worker.last_name || ' works for '  
|| manager.last_name  
FROM employees worker, employees manager  
WHERE worker.manager_id = manager.employee_id ;
```

Use a join to query data from more than one table.

```
SELECT table1.column, table2.column  
FROM table1  
[CROSS JOIN table2] |  
[NATURAL JOIN table2] |
```

```
[JOIN table2 USING (column_name)] |  
[JOIN table2  
ON(table1.column_name = table2.column_name)] |  
[LEFT|RIGHT|FULL OUTER JOIN table2  
ON (table1.column_name = table2.column_name)];
```

In the syntax:

table1.column Denotes the table and column from which data is retrieved

CROSS JOIN Returns a Cartesian product from the two tables

NATURAL JOIN Joins two tables based on the same column name

JOIN table USING column_name Performs an equijoin based on the column name

JOIN table ON table1.column_name Performs an equijoin based on the condition in the ON clause
= table2.column_name

LEFT/RIGHT/FULL OUTER

Creating Cross Joins

- The CROSS JOIN clause produces the crossproduct of two tables.
- This is the same as a Cartesian product between the two tables.

Example:

```
SELECT last_name, department_name  
FROM employees  
CROSS JOIN departments ;  
SELECT last_name, department_name  
FROM employees, departments;
```

Creating Natural Joins

- The NATURAL JOIN clause is based on all columns in the two tables that have the same name.
- It selects rows from the two tables that have equal values in all matched columns.
- If the columns having the same names have different data types, an error is returned.

Example:

```
SELECT department_id, department_name,  
location_id, city  
FROM departments  
NATURAL JOIN locations ;
```

LOCATIONS table is joined to the DEPARTMENT table by the LOCATION_ID column, which is the only column of the same name in both tables. If other common columns were present, the join would have used them all.

Example:

```
SELECT department_id, department_name,  
location_id, city  
FROM departments  
NATURAL JOIN locations  
WHERE department_id IN (20, 50);
```

Creating Joins with the USING Clause

- If several columns have the same names but the data types do not match, the NATURAL JOIN clause can be modified with the USING clause to specify the columns that should be used for an equijoin.
- Use the USING clause to match only one column when more than one column matches.
- Do not use a table name or alias in the referenced columns.
- The NATURAL JOIN and USING clauses are mutually exclusive.

Example:

```
SELECT l.city, d.department_name  
FROM locations l JOIN departments d USING (location_id)  
WHERE location_id = 1400;
```

EXAMPLE:

```
SELECT e.employee_id, e.last_name, d.location_id  
FROM employees e JOIN departments d  
USING (department_id);
```

Creating Joins with the ON Clause

- The join condition for the natural join is basically an equijoin of all columns with the same name.
- To specify arbitrary conditions or specify columns to join, the ON clause is used.
- The join condition is separated from other searchconditions.
- The ON clause makes code easy to understand.

Example:

```
SELECT e.employee_id, e.last_name, e.department_id,  
d.department_id, d.location_id  
FROM employees e JOIN departments d  
ON (e.department_id = d.department_id);
```

EXAMPLE:

```
SELECT e.last_name emp, m.last_name mgr  
FROM employees e JOIN employees m  
ON (e.manager_id = m.employee_id);
```

INNER Versus OUTER Joins

- A join between two tables that returns the results of the inner join as well as unmatched rows left (or right) tables is a left (or right) outer join.
- A join between two tables that returns the results of an inner join as well as the results of a left and right join is a full outer join.

LEFT OUTER JOIN

Example:

```
SELECT e.last_name, e.department_id, d.department_name  
FROM employees e  
LEFT OUTER JOIN departments d  
ON (e.department_id = d.department_id);
```

Example of LEFT OUTER JOIN

This query retrieves all rows in the EMPLOYEES table, which is the left table even if there is no match in the DEPARTMENTS table.

This query was completed in earlier releases as follows:

```
SELECT e.last_name, e.department_id, d.department_name  
FROM employees e, departments d  
WHERE d.department_id (+) = e.department_id;
```

RIGHT OUTER JOIN

Example:

```
SELECT e.last_name, e.department_id, d.department_name  
FROM employees e  
RIGHT OUTER JOIN departments d  
ON (e.department_id = d.department_id);
```

This query retrieves all rows in the DEPARTMENTS table, which is the right table even if there is no

match in the EMPLOYEES table.

This query was completed in earlier releases as follows:

```
SELECT e.last_name, e.department_id, d.department_name  
FROM employees e, departments d  
WHERE d.department_id = e.department_id (+);
```

FULL OUTER JOIN

Example:

```
SELECT e.last_name, e.department_id, d.department_name  
FROM employees e  
FULL OUTER JOIN departments d  
ON (e.department_id = d.department_id);
```

This query retrieves all rows in the EMPLOYEES table, even if there is no match in the DEPARTMENTS table. It also retrieves all rows in the DEPARTMENTS table, even if there is no match in the EMPLOYEES table.

Find the Solution for the following:

1. Write a query to display the last name, department number, and department name for all employees.

Query – select e.last_name, e.department_id, d.dept_name from employees e, department d where e.department_id = d.dept_id;

2. Create a unique listing of all jobs that are in department 80. Include the location of the department in the output.

Query – select distinct (e.job_id), d.location_id from employees e, departments d where d.dept_id = 80 and d.department_id = e.department_id;

3. Write a query to display the employee last name, department name, location ID, and city of all employees who earn a commission

Query – select e.last_name, d.dept_name, d.location_id, l.city from employees e, department d, location & where e.commission_pct is not null;

8. Display the employee last name and department name for all employees who have an a(lowercase) in their last names. P

Query – select e.last_name, d.department_name from employees e, department d where e.last_name like '%a%';

5. Write a query to display the last name, job, department number, and department name for all employees who work in Toronto.

Query – select e.last_name, e.job_id, e.department_id, d.department from employees e, department d, location l where e.department_id = d.department_id and l.city = ‘Toronto’, and d.location_id = l.location_id;

6. Display the employee last name and employee number along with their manager’s last name and manager number. Label the columns Employee, Emp#, Manager, and Mgr#, Respectively

Query – select e.last_name = “employee”, e.emp_id “Emp#”, m.last_name “Manager”, m.emp_id ‘Mgr#’ from employees e, employee m where m.employee_id = e.manager_id;

7. Modify lab4_6.sql to display all employees including King, who has no manager. Order the results by the employee number.

Query – select e.last_name “Employee”, e.emp_id “Emp#”, m.last_name “Manager”, m.emp_id “Mgr#” from employees e left outer join employee m on m.emp_id = e.manager_id;

8. Create a query that displays employee last names, department numbers, and all the employees who work in the same department as a given employee. Give each column an appropriate label

Query – select e.last_name, e.department_id, e.last_name from employees e JOIN employees c on (e.department_id = c.department_id) where e.employee_id != c.employee_id order by e.department_id, e.last_name, c.last_name;

9. Show the structure of the JOB_GRADES table. Create a query that displays the name, job, department name, salary, and grade for all employees

Query - Desc job_grades;

Select e.last_name, e.job_id, d.department_name, e.salary, j.grade from employees e, department d, job_grade j where e.salary between j.lowest_salary and j.highest_salary;

10. Create a query to display the name and hire date of any employee hired after employee Davies.

Query – select last_name, hire_date from employees where hire_date > (select hire_date from employees where last_name= ‘Davies’);

Ex. No. : **09**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Aggregating Data Using Group Functions

Objectives

After the completion of this exercise, the students will be able to do the following:

- Identify the available group functions
- Describe the use of group functions
- Group data by using the GROUP BY clause
- Include or exclude grouped rows by using the HAVING clause

What Are Group Functions?

Group functions operate on sets of rows to give one result per group

Types of Group Functions

- AVG
- COUNT
- MAX
- MIN
- STDDEV
- SUM
- VARIANCE

Each of the functions accepts an argument. The following table identifies the options that you can use in the syntax:

Function	Description
AVG ([DISTINCT ALL] <i>n</i>)	Average value of <i>n</i> , ignoring null values
COUNT ({ * [DISTINCT ALL] <i>expr</i> })	Number of rows, where <i>expr</i> evaluates to something other than null (count all selected rows using *, including duplicates and rows with nulls)
MAX ([DISTINCT ALL] <i>expr</i>)	Maximum value of <i>expr</i> , ignoring null values
MIN ([DISTINCT ALL] <i>expr</i>)	Minimum value of <i>expr</i> , ignoring null values
STDDEV ([DISTINCT ALL] <i>x</i>)	Standard deviation of <i>n</i> , ignoring null values
SUM ([DISTINCT ALL] <i>n</i>)	Sum values of <i>n</i> , ignoring null values
VARIANCE ([DISTINCT ALL] <i>x</i>)	Variance of <i>n</i> , ignoring null values

Group Functions: Syntax

SELECT [*column*,] *group_function(column)*, ...

FROM *table*

[WHERE *condition*]

[GROUP BY *column*]

[ORDER BY *column*];

Guidelines for Using Group Functions

- DISTINCT makes the function consider only nonduplicate values; ALL makes it consider every value, including duplicates. The default is ALL and therefore does not need to be specified.
- The data types for the functions with an expr argument may be CHAR, VARCHAR2, NUMBER, or DATE.
- All group functions ignore null values.

Using the AVG and SUM Functions

You can use AVG and SUM for numeric data.

SELECT AVG(salary), MAX(salary),

MIN(salary), SUM(salary)

FROM employees

```
WHERE job_id LIKE '%REP%';
```

Using the MIN and MAX Functions

You can use MIN and MAX for numeric, character, and date data types.

```
SELECT MIN(hire_date), MAX(hire_date)  
FROM employees;
```

You can use the MAX and MIN functions for numeric, character, and date data types. example displays the most junior and most senior employees.

The following example displays the employee last name that is first and the employee last name that is last in an alphabetized list of all employees:

```
SELECT MIN(last_name), MAX(last_name)  
FROM employees;
```

Note: The AVG, SUM, VARIANCE, and STDDEV functions can be used only with numeric data types. MAX and MIN cannot be used with LOB or LONG data types.

Using the COUNT Function

COUNT(*) returns the number of rows in a table:

```
SELECT COUNT(*)  
FROM employees  
WHERE department_id = 50;  
  
COUNT(expr) returns the number of rows with nonnull  
values for the expr:  
  
SELECT COUNT(commission_pct)  
FROM employees  
WHERE department_id = 80;
```

Using the DISTINCT Keyword

- COUNT(DISTINCT *expr*) returns the number of distinct non-null values of the *expr*.
- To display the number of distinct department values in the EMPLOYEES table:

```
SELECT COUNT(DISTINCT department_id) FROM employees;
```

Use the DISTINCT keyword to suppress the counting of any duplicate values in a column.

Group Functions and Null Values

Group functions ignore null values in the column:

```
SELECT AVG(commission_pct)  
FROM employees;
```

The NVL function forces group functions to include null values:

```
SELECT AVG(NVL(commission_pct, 0))  
FROM employees;
```

Creating Groups of Data

To divide the table of information into smaller groups. This can be done by using the GROUP BY clause.

GROUP BY Clause Syntax

```
SELECT column, group_function(column)  
FROM table  
[WHERE condition]  
[GROUP BY group_by_expression]  
[ORDER BY column];
```

In the syntax:

group_by_expression specifies columns whose values determine the basis for

grouping rows

Guidelines

- If you include a group function in a SELECT clause, you cannot select individual results as well, *unless* the individual column appears in the GROUP BY clause. You receive an error message if you fail to include the column list in the GROUP BY clause.
- Using a WHERE clause, you can exclude rows before dividing them into groups.
- You must include the *columns* in the GROUP BY clause.
- You cannot use a column alias in the GROUP BY clause.

Using the GROUP BY Clause

All columns in the SELECT list that are not in group functions must be in the GROUP BY clause.

```
SELECT department_id, AVG(salary)
FROM employees
GROUP BY department_id ;
```

The GROUP BY column does not have to be in the SELECT list.

```
SELECT AVG(salary) FROM employees GROUP BY department_id ;
```

You can use the group function in the ORDER BY clause:

```
SELECT department_id, AVG(salary) FROM employees GROUP BY department_id ORDER
BY AVG(salary);
```

Grouping by More Than One Column

```
SELECT department_id dept_id, job_id, SUM(salary) FROM employees
GROUP BY department_id, job_id ;
```

Illegal Queries Using Group Functions

Any column or expression in the SELECT list that is not an aggregate function must be in the GROUP

BY clause:

```
SELECT department_id, COUNT(last_name) FROM employees;
```

You can correct the error by adding the GROUP BY clause:

```
SELECT department_id, count(last_name) FROM employees GROUP BY department_id;
```

You cannot use the WHERE clause to restrict groups.

- You use the HAVING clause to restrict groups.
- You cannot use group functions in the WHERE clause.

```
SELECT department_id, AVG(salary) FROM employees WHERE AVG(salary) > 8000  
GROUP BY department_id;
```

You can correct the error in the example by using the HAVING clause to restrict groups:

```
SELECT department_id, AVG(salary) FROM employees  
HAVING AVG(salary) > 8000 GROUP BY department_id;
```

Restricting Group Results

With the HAVING Clause .When you use the HAVING clause, the Oracle server restricts groups as follows:

1. Rows are grouped.
2. The group function is applied.
3. Groups matching the HAVING clause are displayed.

Using the HAVING Clause

```
SELECT department_id, MAX(salary) FROM employees  
GROUP BY department_id HAVING MAX(salary)>10000 ;
```

The following example displays the department numbers and average salaries for those departments with a maximum salary that is greater than \$10,000:

```
SELECT department_id, AVG(salary) FROM employees GROUP BY department_id  
HAVING max(salary)>10000;
```

Example displays the job ID and total monthly salary for each job that has a total payroll exceeding \$13,000. The example excludes sales representatives and sorts the list by the total monthly salary.

```
SELECT job_id, SUM(salary) PAYROLL FROM employees WHERE job_id NOT LIKE  
'%REP%'  
GROUP BY job_id HAVING SUM(salary) > 13000 ORDER BY SUM(salary);
```

Nesting Group Functions

Display the maximum average salary:

Group functions can be nested to a depth of two. The slide example displays the maximum average salary.

```
SELECT MAX(AVG(salary)) FROM employees GROUP BY department_id;
```

Summary

In this exercise, students should have learned how to:

- Use the group functions COUNT, MAX, MIN, and AVG
- Write queries that use the GROUP BY clause
- Write queries that use the HAVING clause

```
SELECT column, group_function  
FROM table  
[WHERE condition]  
[GROUP BY group_by_expression]  
[HAVING group_condition]  
[ORDER BY column];
```

Find the Solution for the following:

Determine the validity of the following three statements. Circle either True or False.

1. Group functions work across many rows to produce one result per group.

True/False - **TRUE**

2. Group functions include nulls in calculations.

True/False - **FALSE**

3. The WHERE clause restricts rows prior to inclusion in a group calculation.

True/False - **TRUE**

The HR department needs the following reports:

4. Find the highest, lowest, sum, and average salary of all employees. Label the columns Maximum, Minimum, Sum, and Average, respectively. Round your results to the nearest whole number

Query – select max (salary) * “maximum”, min(salary) “minimum”, avg (salary) “Average” from employees;

Select round (max (salary),0), round (min (salary),0), round (avg(salary), 0) from employees;

5. Modify the above query to display the minimum, maximum, sum, and average salary for each job type.

Query - select round (min (salary), 0) “Minimum”, round (max(salary),0) “Maximum”, round(avg (salary),0) “Average”, round(sum(salary),0) “sum”, job_id from employees group by job_id;

6. Write a query to display the number of people with the same job. Generalize the query so that the user in the HR department is prompted for a job title.

Query – select count (*) “count of employees” from employees group by job_id having job_id = :x;

7. Determine the number of managers without listing them. Label the column Number of Managers. *Hint: Use the MANAGER_ID column to determine the number of managers.*

Query – select count (distinct (manager_id)) from employees;
Select count (manager_id) from employees group by manager_id;

8. Find the difference between the highest and lowest salaries. Label the column DIFFERENCE.

Query – select max (salary) – min(salary) “difference” from employees;

9. Create a report to display the manager number and the salary of the lowest-paid employee for that manager. Exclude anyone whose manager is not known. Exclude any groups where the minimum salary is \$6,000 or less. Sort the output in descending order of salary.

Query - select manager_id, min(salary) “lowest_paid” from employees group by manager_id having min(salary) > 6000 order by min(salary) DESC;

10. Create a query to display the total number of employees and, of that total, the number of employees hired in 1995, 1996, 1997, and 1998. Create appropriate column headings.

Query – select count (*) total, sum (decode(to _char (hire _date, yyyy), 2005,1,0)) “2005”, sum (decode(to _char (hire _date, yyyy), 2006,1,0)) “2006”, sum (decode(to _char (hire _date, yyyy), 2007,1,0)) “2007”, sum (decode(to _char (hire _date, yyyy), 2008,1,0)) “2008”, from employees;

11. Create a matrix query to display the job, the salary for that job based on department number, and the total salary for that job, for departments 20, 50, 80, and 90, giving each column an appropriate heading.

Query - select job_id “Job”, sum (decode(dept_id, 20, salary) “Dept 20” , sum (decode(dept_id, 50, salary) “Dept 50” , sum (decode(dept_id, 80, salary) “Dept 80” , sum (decode(dept_id, 90, salary) “Dept 90” , sum (salary) from employees group by job_id;

12. Write a query to display each department’s name, location, number of employees, and the average salary for all the employees in that department. Label the column name-Location, Number of people, and salary respectively. Round the average salary to two decimal places.

Query - select d.department_name, d.location_id “Location”, count(*) “number of people”, avg (salary) “Salary” from employees e, department d where e.department_id = d.department_id group by d.department_name, d.location_id;

Ex. No. : **P-5**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Date Functions

1. For DJs on Demand, display the number of months between the event_date of the Vigil wedding and today's date. Round to the nearest month.

Query – select round F_months between (sysdate, event_date) from d_events where name = ‘Vigil wedding’;

2. Display the days between the start of last summer’s school vacation break and the day school started this year. Assume 30.5 days per month. Name the output “Days.”

Query – select + (months_between (to_date (“11-02-2024”, “dd-mm-yyyy”), to_date (‘22-12-2023’, ‘dd-mm-yyyy’) 30.5) ;

3. Display the days between January 1 and December 31.

Query – select to_date (‘31-12-2024’, ‘dd-mm-yyyy’) – to_date (‘01-01-2024’, ‘dd-mm-yyyy’) from dual;

4. Using one statement, round today's date to the nearest month and nearest year and truncate it to the nearest month and nearest year. Use an alias for each column.

Query – select round (sysdate, ‘month’) as “nearest first day of month”, round (sysdate, ‘year’) as “nearest first day of year”, trunc (sysdate, ‘month’) as “current first day of month”, trunc (sysdate, ‘year’) as “current first day of month”, from dual;

5. What is the last day of the month for June 2005? Use an alias for the output.

Query – select last_day (to_date (‘01-Jun-2005’, ‘dd-mm-yyyy’)) from dual ;

6. Display the number of years between the Global Fast Foods employee Bob Miller’s birthday and today. Round to the nearest year.

Query – select round (months_between (sysdate, birthdate) |12) from f_staffs where first_name || ‘|| last_name ‘Bob Miller’ ;

7.Your next appointment with the dentist is six months from today. On what day will you go to the dentist? Name the output, “Appointment.”

Query – select to_char (add_months (sysdate) , dd-mm-yyyy(dy)) as ‘appointment’ as duals;

8.The teacher said you have until the last day of this month to turn in your research paper. What day will this be? Name the output, “Deadline.”

Query – select to_char (last_day (sysdate), ‘ dd-mm-yyyy (DY)’) as “Deadline” from dual;

9.How many months between your birthday this year and January 1 next year?

Query – select round (months_between(trunc (add_months(to_date('12-12-2024', 'dd-mm-yyyy'),0) , ‘year’), to_date ('22-12-2024', ‘dd-mm-yyyy’))) from dual ;

10.What’s the date of the next Friday after your birthday this year? Name the output, “First Friday.”

Query - select next_day (to_date ('22-12-2024', ‘dd-mm-yyyy’), ‘Friday’) as “First Friday “ from dual ;

11. Name a date function that will return a number.

Query – months_between

12.Name a date function that will return a date.

Query – to_date, add_months

13.Give one example of why it is important for businesses to be able to manipulate date data?

Solution – business based on subscription need to manipulate date data to check hows long and when will subscription of user will expire.

Conversion Functions

In each of the following exercises, feel free to use labels for the converted column to make the output more readable.

1. List the last names and birthdays of Global Fast Food Employees. Convert the birth dates to character data in the Month DD, YYYY format. Suppress any leading zeros.

Query – select last_name, to_char (birthdate, “month DD, YYYY”) as birthdate from f_staffs;

2. Convert January 3, 04, to the default date format 03-Jan-2004.

Query – select to_char (to_date(‘january 3, 04’, ‘month DD YY’), ‘dd-mm-yyyy’) from dual;

3. Format a query from the Global Fast Foods f_promotional_menus table to print out the start_date of promotional code 110 as: The promotion began on the tenth of February 2004.

Query - select to_char (start_date, “The promotion began on the “dspt” of ‘Month yyyy’) from f_promotional_menus where code = 110 ;

4. Convert today’s date to a format such as: “Today is the Twentieth of March, Two Thousand Four”

Query - select to_char (sysdate, “Today 13”, Ddspt of “Month” ,”yyysy”) from dual;

5. List the ID, name and salary for all Global Fast Foods employees. Display salary with a \$ sign and two decimal places.

Query – select id, first_name || ‘ ‘ || last_name ‘name’, ‘\$’ || round (salary) from f_staffs;

Ex. No. : **10**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Sub queries

Objectives

After completing this lesson, you should be able to do the following:

- Define subqueries
- Describe the types of problems that subqueries can solve
- List the types of subqueries
- Write single-row and multiple-row subqueries

Using a Subquery to Solve a Problem

Who has a salary greater than Abel's?

Main query:

Which employees have salaries greater than Abel's salary?

Subquery:

What is Abel's salary?

Subquery Syntax

`SELECT select_list FROM table WHERE expr operator (SELECT select_list FROM table);`

- The subquery (inner query) executes once before the main query (outer query).
- The result of the subquery is used by the main query.

A subquery is a SELECT statement that is embedded in a clause of another SELECT statement. You can build powerful statements out of simple ones by using subqueries. They can be very useful when you need to select rows from a table with a condition that depends on the data in the table itself.

You can place the subquery in a number of SQL clauses, including the following:

- WHERE clause
- HAVING clause
- FROM clause

In the syntax:

operator includes a comparison condition such as $>$, $=$, or IN

Note: Comparison conditions fall into two classes: single-row operators

($>$, $=$, \geq , $<$, \neq , \leq) and multiple-row operators (IN, ANY, ALL). statement. The subquery generally executes first, and its output is used to complete the query condition for the main (or outer) query

Using a Subquery

```
SELECT last_name FROM employees WHERE salary > (SELECT salary FROM employees  
WHERE last_name = 'Abel');
```

The inner query determines the salary of employee Abel. The outer query takes the result of the inner query and uses this result to display all the employees who earn more than this amount.

Guidelines for Using Subqueries

- Enclose subqueries in parentheses.
- Place subqueries on the right side of the comparison condition.
- The ORDER BY clause in the subquery is not needed unless you are performing Top-N analysis.
- Use single-row operators with single-row

subqueries, and use multiple-row operators with multiple-row subqueries.

Types of Subqueries

- Single-row subqueries: Queries that return only one row from the inner SELECT statement.
- Multiple-row subqueries: Queries that return more than one row from the inner SELECT statement.

Single-Row Subqueries

- Return only one row
- Use single-row comparison operators

Example

Display the employees whose job ID is the same as that of employee 141:

```
SELECT last_name, job_id FROM employees WHERE job_id = (SELECT job_id FROM
employees
WHERE employee_id = 141);
```

Displays employees whose job ID is the same as that of employee 141 and whose salary is greater

than that of employee 143.

```
SELECT last_name, job_id, salary FROM employees WHERE job_id = (SELECT job_id FROM
employees WHERE employee_id = 141) AND salary > (SELECT salary FROM employees
WHERE employee_id = 143);
```

Using Group Functions in a Subquery

Displays the employee last name, job ID, and salary of all employees whose salary is equal to the minimum salary. The MIN group function returns a single value (2500) to the outer query.

```
SELECT last_name, job_id, salary FROM employees WHERE salary = (SELECT MIN(salary)
```

FROM employees);

The HAVING Clause with Subqueries

- The Oracle server executes subqueries first.
- The Oracle server returns results into the HAVING clause of the main query.

Displays all the departments that have a minimum salary greater than that of department 50.

```
SELECT department_id, MIN(salary)
FROM employees
GROUP BY department_id
HAVING MIN(salary) >
(SELECT MIN(salary)
FROM employees
WHERE department_id = 50);
```

Example

Find the job with the lowest average salary.

```
SELECT job_id, AVG(salary)
FROM employees
GROUP BY job_id
HAVING AVG(salary) = (SELECT MIN(AVG(salary)))
FROM employees
GROUP BY job_id);
```

What Is Wrong in this Statements?

```
SELECT employee_id, last_name
FROM employees
WHERE salary = (SELECT MIN(salary) FROM employees GROUP BY department_id);
Will This Statement Return Rows?
SELECT last_name, job_id
```

```
FROM employees  
WHERE job_id =(SELECT job_id FROM employees WHERE last_name = 'Haas');
```

Multiple-Row Subqueries

- Return more than one row
- Use multiple-row comparison operators

Example

Find the employees who earn the same salary as the minimum salary for each department.

```
SELECT last_name, salary, department_id FROM employees WHERE salary IN (SELECT  
MIN(salary)  
FROM employees GROUP BY department_id);
```

Using the ANY Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary FROM employees WHERE salary < ANY  
(SELECT salary FROM employees WHERE job_id = 'IT_PROG') AND job_id <> 'IT_PROG';
```

Displays employees who are not IT programmers and whose salary is less than that of any IT programmer. The maximum salary that a programmer earns is \$9,000.

< ANY means less than the maximum. >ANY means more than the minimum. =ANY is equivalent to IN.

Using the ALL Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary  
FROM employees  
WHERE salary < ALL (SELECT salary FROM employees WHERE job_id = 'IT_PROG')  
AND job_id <> 'IT_PROG';
```

Displays employees whose salary is less than the salary of all employees with a job ID of IT_PROG and whose job is not IT_PROG.

➤ ALL means more than the maximum, and <ALL means less than the minimum.

The NOT operator can be used with IN, ANY, and ALL operators.

Null Values in a Subquery

```
SELECT emp.last_name FROM employees emp  
WHERE emp.employee_id NOT IN (SELECT mgr.manager_id FROM employees mgr);
```

Notice that the null value as part of the results set of a subquery is not a problem if you use the IN operator. The IN operator is equivalent to =ANY. For example, to display the employees who have subordinates, use the following SQL statement:

```
SELECT emp.last_name  
FROM employees emp  
WHERE emp.employee_id IN (SELECT mgr.manager_id FROM employees mgr);
```

Display all employees who do not have any subordinates:

```
SELECT last_name FROM employees  
WHERE employee_id NOT IN (SELECT manager_id FROM employees WHERE manager_id  
IS NOT NULL);
```

Find the Solution for the following:

1. The HR department needs a query that prompts the user for an employee last name. The query then displays the last name and hire date of any employee in the same department as the employee whose name they supply (excluding that employee). For example, if the user enters Zlotkey, find all employees who work with Zlotkey (excluding Zlotkey).

Query – select last_name, hire_date from employees where department_id = (select department_id from employees where last_name like : name) and last_name<>:name;

2. Create a report that displays the employee number, last name, and salary of all employees who earn more than the average salary. Sort the results in order of ascending salary.

Query - select employee_id, last_name, salary from employees where salary > (select avg (salary) from employee);

3. Write a query that displays the employee number and last name of all employees who work in a department with any employee whose last name contains a *u*.

Query – select employee_id, last_name from employees where department_id in (select department_id from employees where lower(last_name) like ‘ % u % ’);

4. The HR department needs a report that displays the last name, department number, and job ID of all employees whose department location ID is 1700.

Query - select last_name, department_id, job_id from employees where department_id in (select department_id from departments where location_id = 1700);

5. Create a report for HR that displays the last name and salary of every employee who reports to King.

Query - select last_name, salary from employees where manager_id in (select employee_id from employees where last_name = ‘King’);

6. Create a report for HR that displays the department number, last name, and job ID for every employee in the Executive department.

round (sysdate, ‘month’) as “nearest first day of month”

Query – select department_id, last_name, job_id from employees where department_id in (select department_id from departments where department_name = ‘Executive’);

7. Modify the query 3 to display the employee number, last name, and salary of all employees who earn more than the average salary and who work in a department with any employee whose last name contains a *u*.

Query - select employee_id, last_name from employees where salary < (select avg(salary) from employees) and department_id in (select department_id from employees where lower(last_name) like '%4%');

P Abhignya - 221701002

Practice Questions

1. Ellen Abel is an employee who has received a \$2,000 raise. Display her first name and last name, her current salary, and her new salary. Display both salaries with a \$ and two decimal places. Label her new salary column AS New Salary.

Query - select first_name, last_name, to_char (salary, '\$999999.99') "current salary", to_char (salary, '\$999999.99') "new salary", from employees where first_name || ' ' || last_name = ' Ellen Abbe' ;

2. On what day of the week and date did Global Fast Foods' promotional code 110 Valentine's Special begin?

Query – select start_date from f-promotional_menus where code = 110;
to_char (start_date, 'day');

3. Create one query that will convert 25-Dec-2004 into each of the following (you will have to convert 25-Dec-2004 to a date and then to character data):

December 25th, 2004

DECEMBER 25TH, 2004

25th december, 2004

Query – select to_char (to_date (' 25-Dec-2004' , ' dd-mm-yyyy') 'ddth-month-yyyy');
select to_char (to_date (' 25-Dec-2004' , ' dd-mm-yyyy') 'month-ddth-yyyy');
select to_char (to_date (' 25-Dec-2004' , ' dd-mm-yyyy') 'month-ddth-yyyy');

4. Create a query that will format the DJs on Demand d_packages columns, low-range and high-range package costs, in the format \$2500.00.

Query – select code, to_char (low_range, '\$999999.99') "low range", to_char (high_range, '\$999999.99') "high range" from d_packages;

5. Convert JUNE192004 to a date using the fx format model.

Query – select to_date ('June 192004', 'MONTHddyyyy') from dual;

6. What is the distinction between implicit and explicit datatype conversion? Give an example of each.

Solution - implicit datatype conversion is datatype of a data is converted automatically. In explicit datatype conversion, a datatype is converted by user for his/her use. Ex-data datatype default format is mmdd yyyy with to_char function we can convert it to our will.

7. Why is it important from a business perspective to have datatype conversions?

Solution - it is important from a business perspective to have datatype conversion because different country represent date differently and currency symbol to format those datatype conversion are needed.

USING THE SET OPERATORS

Objectives

After the completion this exercise, the students should be able to do the following:

- Describe set operators
- Use a set operator to combine multiple queries into a single query
- Control the order of rows returned

The set operators combine the results of two or more component queries into one result.

Queries containing set operators are called *compound queries*.

Operator	Returns
UNION	All distinct rows selected by either query
UNION ALL	All rows selected by either query, including all duplicates
INTERSECT	All distinct rows selected by both queries
MINUS	All distinct rows that are selected by the first SELECT statement and not selected in the second SELECT statement

The tables used in this lesson are:

- EMPLOYEES: Provides details regarding all current employees

- **JOB_HISTORY:** Records the details of the start date and end date of the former job, and the job identification number and department when an employee switches jobs

UNION Operator

Guidelines

- The number of columns and the data types of the columns being selected must be identical in all the SELECT statements used in the query. The names of the columns need not be identical.
- UNION operates over all of the columns being selected.
- NULL values are not ignored during duplicate checking.
- The IN operator has a higher precedence than the UNION operator.
- By default, the output is sorted in ascending order of the first column of the SELECT clause.

Example:

Display the current and previous job details of all employees. Display each employee only once.

```
SELECT employee_id, job_id FROM employees UNION SELECT employee_id, job_id  
FROM job_history;
```

Example:

```
SELECT employee_id, job_id, department_id  
FROM employees  
UNION
```

```
SELECT employee_id, job_id, department_id  
FROM job_history;
```

UNION ALL Operator

Guidelines

The guidelines for UNION and UNION ALL are the same, with the following two exceptions that pertain to UNION ALL:

- Unlike UNION, duplicate rows are not eliminated and the output is not sorted by default.
- The DISTINCT keyword cannot be used.

Example:

Display the current and previous departments of all employees.

```
SELECT employee_id, job_id, department_id  
FROM employees  
UNION ALL  
  
SELECT employee_id, job_id, department_id  
FROM job_history  
ORDER BY employee_id;
```

INTERSECT Operator

Guidelines

- The number of columns and the data types of the columns being selected by the SELECT statements in the queries must be identical in all the SELECT statements used in the query. The names of the columns need not be identical.
- Reversing the order of the intersected tables does not alter the result.
- INTERSECT does not ignore NULL values.

Example:

Display the employee IDs and job IDs of those employees who currently have a job title that is the same as their job title when they were initially hired (that is, they changed jobs but have now gone back to doing their original job).

```
SELECT employee_id, job_id FROM employees  
INTERSECT  
SELECT employee_id, job_id  
FROM job_history;
```

Example

```
SELECT employee_id, job_id, department_id  
FROM employees  
INTERSECT  
SELECT employee_id, job_id, department_id  
FROM job_history;
```

MINUS Operator

Guidelines

- The number of columns and the data types of the columns being selected by the SELECT statements in the queries must be identical in all the SELECT statements used in the query. The names of the columns need not be identical.
- All of the columns in the WHERE clause must be in the SELECT clause for the MINUS operator to work.

Example:

Display the employee IDs of those employees who have not changed their jobs even once.

```
SELECT employee_id, job_id  
FROM employees  
MINUS  
SELECT employee_id, job_id  
FROM job_history;
```

:

Find the Solution for the following:

1. The HR department needs a list of department IDs for departments that do not contain the job ID ST_CLERK. Use set operators to create this report.

Query - (select last_name, department_id, to_char(null) from employees) union (select to_char(null), department_id, department = name from departments);

2. The HR department needs a list of countries that have no departments located in them. Display the country ID and the name of the countries. Use set operators to create this report.

Query – select country_id, country_name from countries minus select l.country_id, c.country_name from location l, countries c where l.country_id = c.country_id;

3. Produce a list of jobs for departments 10, 50, and 20, in that order. Display job ID and department ID using set operators.

Query – select employee_id, job_id from employees intersect
Select employee_id, job_id from job_history;

4. Create a report that lists the employee IDs and job IDs of those employees who currently have a job title that is the same as their job title when they were initially hired by the company (that is, they changed jobs but have now gone back to doing their original job).

Query – select job_id, department_id, 'a' from employees where department_id = 10 union
select job_id, department_id, 'b' from employees where department_id = 50 union

Select job_id, department_id, 'c', from employees where department_id = 20 order by s;

5. The HR department needs a report with the following specifications:

- Last name and department ID of all the employees from the EMPLOYEES table, regardless of whether or not they belong to a department.

- Department ID and department name of all the departments from the DEPARTMENTS table, regardless of whether or not they have employees working in them Write a compound query to accomplish this.

Query - select department_id from departments minus

Select department_id from employee where job_id = 'ST_CLERK' ;

P Abhignya - 221701002

Ex. No. : **12**

Date:

Register No.: **221701002**

Name: **P Abhignya**

NULL Functions

1. Create a report that shows the Global Fast Foods promotional name, start date, and end date from the f_promotional_menus table. If there is an end date, temporarily replace it with “end in two weeks”. If there is no end date, replace it with today’s date.

Query - select name, start_date, NULL ('end_date, "end in two weeks") from f_promotional_menus;

2. Not all Global Fast Foods staff members receive overtime pay. Instead of displaying a null value for these employees, replace null with zero. Include the employee’s last name and overtime rate in the output. Label the overtime rate as “Overtime Status”.

Query – select last_name, NULL(overtime_rate,0) from f_staffs;

3. The manager of Global Fast Foods has decided to give all staff who currently do not earn overtime an overtime rate of \$5.00. Construct a query that displays the last names and the overtime rate for each staff member, substituting \$5.00 for each null overtime value.

Query – select last_name, to_char (NULL(overtime_rate,5), '\$999.99') from f_staffs;

4. Not all Global Fast Foods staff members have a manager. Create a query that displays the employee last name and 9999 in the manager ID column for these employees.

Query - select last_name, NULL (manager_id, 9999) as manager_id from f_staffs;

5. Which statement(s) below will return null if the value of v_sal is 50?

- a. SELECT nvl(v_sal, 50) FROM emp;
- b. SELECT nvl2(v_sal, 50) FROM emp;
- c. SELECT nullif(v_sal, 50) FROM emp;
- d. SELECT coalesce (v_sal, Null, 50) FROM emp;

Solution – C) SELECT nullif(v_sal, 50) FROM emp;

6. What does this query on the Global Fast Foods table return?

```
SELECT COALESCE(last_name, to_char(manager_id)) as NAME  
FROM f_staffs;
```

Query - return last_name of all employees in f_staffs table

- 7a. Create a report listing the first and last names and month of hire for all employees in the EMPLOYEES table (use TO_CHAR to convert hire_date to display the month).

Query – select first_name, last_name, to_char(hire_date, ‘Month’) as “Hire month” from employees;

- b. Modify the report to display null if the month of hire is September. Use the NULLIF function.

Query – select first_name, last_name, NULL(to_char(hire_date, ‘month’, ‘september’)) as “Hire Month” from employees;

8. For all null values in the specialty column in the DJs on Demand d_partners table, substitute “No Specialty.” Show the first name and specialty columns only.

Query – select first_name, NULL(specialty, ‘ No specialty’, specialty) as specialty d_partners;

Conditional Expressions

- From the DJs on Demand d_songs table, create a query that replaces the 2-minute songs with “shortest” and the 10-minute songs with “longest”. Label the output column “Play Times”.

Query - select title, case when duration = 2 then ‘shortest’ when duration = 10 then ‘longest’ else duration end as “Duration” from d_songs;

- Use the Oracle database employees table and CASE expression to decode the department id. Display the department id, last name, salary and a column called “New Salary” whose value is based on the following conditions:

If the department id is 10 then $1.25 * \text{salary}$ If

the department id is 90 then $1.5 * \text{salary}$

If the department id is 130 then $1.75 * \text{salary}$

Otherwise, display the old salary.

Query – select department_id, last_name, salary, case department_id when 10 then salary * 1.25 when 90 then salary * 1.5 when 130 then salary * 1.75 else salary end as “New Salary” from employees;

- Display the first name, last name, manager ID, and commission percentage of all employees in departments 80 and 90. In a 5th column called “Review”, again display the manager ID. If they don’t have a manager, display the commission percentage. If they don’t have a commission, display 99999.

Query – select first_name, last_name, manager_id, commission_pt, case when manager_id is NULL and commission_pt is null then 99999

When manager_id is NULL then commission_pt else manager_id end as “Review” from employees;

Cross Joins and Natural Joins

Use the Oracle database for problems 1-4.

1. Create a cross-join that displays the last name and department name from the employees and departments tables.

Query- select last_name, department_name from employees cross join departments;

2. Create a query that uses a natural join to join the departments table and the locations table. Display the department id, department name, location id, and city.

Query – select department_id, department_name, location_id, city from natural join locations;

3. Create a query that uses a natural join to join the departments table and the locations table. Restrict the output to only department IDs of 20 and 50. Display the department id, department name, location id, and city.

Query – select department_id, department_name, location_id, city from departments natural join locations where department_id in (20,50);

Ex. No. : **13**

Date:

Register No.: **221701002**

Name: **P Abhignya**

CREATING VIEWS

After the completion of this exercise, students will be able to do the following:

- Describe a view
- Create, alter the definition of, and drop a view
- Retrieve data through a view
- Insert, update, and delete data through a view
- Create and use an inline view

View

A view is a logical table based on a table or another view. A view contains no data but is like a window through which data from tables can be viewed or changed. The tables on which a view is based are called base tables.

Advantages of Views

- To restrict data access
- To make complex queries easy
- To provide data independence
- To present different views of the same data

Classification of views

1. Simple view
2. Complex view

Feature	Simple	Complex
No. of tables	One	One or more
Contains functions	No	Yes
Contains groups of data	No	Yes
DML operations thr' view	Yes	Not always

Creating a view

Syntax

CREATE OR REPLACE FORCE/NOFORCE VIEW view_name AS Subquery WITH CHECK
OPTION CONSTRAINT constraint WITH READ ONLY CONSTRAINT constraint;

FORCE - Creates the view regardless of whether or not the base tables exist.

NOFORCE - Creates the view only if the base table exist.

WITH CHECK OPTION CONSTRAINT-specifies that only rows accessible to the view can be inserted or updated.

WITH READ ONLY CONSTRAINT-ensures that no DML operations can be performed on the view.

Example: 1 (Without using Column aliases)

Create a view EMPVU80 that contains details of employees in department80.

Example 2:

CREATE VIEW empvu80 AS SELECT employee_id, last_name, salary FROM employees

```
WHERE department_id=80;
```

Example:1 (Using column aliases)

```
CREATE VIEW salvu50
```

```
AS SELECT employee_id,id_number, last_name NAME, salary *12 ANN_SALARY  
FROM employees  
WHERE department_id=50;
```

Retrieving data from a view

Example:

```
SELECT * from salvu50;
```

Modifying a view

A view can be altered without dropping, re-creating.

Example: (Simple view)

Modify the EMPVU80 view by using CREATE OR REPLACE.

```
CREATE OR REPLACE VIEW empvu80 (id_number, name, sal, department_id)  
AS SELECT employee_id,first_name, last_name, salary, department_id  
FROM employees  
WHERE department_id=80;
```

Example: (complex view)

```
CREATE VIEW dept_sum_vu (name, minsal, maxsal,avgsal)  
AS SELECT d.department_name, MIN(e.salary), MAX(e.salary), AVG(e.salary)
```

```
FROM employees e, department d  
WHERE e.department_id=d.department_id  
GROUP BY d.department_name;
```

Rules for performing DML operations on view

- Can perform operations on simple views
- Cannot remove a row if the view contains the following:
 - Group functions
 - Group By clause
 - Distinct keyword
- Cannot modify data in a view if it contains
 - Group functions
 - Group By clause
 - Distinct keyword
 - Columns contain by expressions
- Cannot add data thr' a view if it contains
 - Group functions
 - Group By clause
 - Distinct keyword
 - Columns contain by expressions
 - NOT NULL columns in the base table that are not selected by the view

Example: (Using the WITH CHECK OPTION clause)

```
CREATE OR REPLACE VIEW empvu20  
AS    SELECT *  
      FROM employees  
     WHERE department_id=20  
   WITH CHECK OPTION CONSTRAINT empvu20_ck;
```

Note: Any attempt to change the department number for any row in the view fails because it violates the WITH CHECK OPTION constraint.

Example – (Execute this and note the error)

```
UPDATE empvu20 SET department_id=10 WHERE employee_id=201;
```

Denying DML operations

Use of WITH READ ONLY option.

Any attempt to perform a DML on any row in the view results in an oracle server error.

Try this code:

```
CREATE OR REPLACE VIEW empvu10(employee_number, employee_name, job_title)
AS SELECT employee_id, last_name, job_id
FROM employees
WHERE department_id=10
WITH READ ONLY;
```

Find the Solution for the following:

1. Create a view called EMPLOYEE_VU based on the employee numbers, employee names and department numbers from the EMPLOYEES table. Change the heading for the employee name to EMPLOYEE.

Query – create or replace view employees_vu as select employee_id, last_name employee, department_id from employees;

2. Display the contents of the EMPLOYEES_VU view.

Query – select * from employee_vu;

3. Select the view name and text from the USER_VIEWS data dictionary views.

Query – select Long 600 select view_name, text from user_views;

4. Using your EMPLOYEES_VU view, enter a query to display all employees names and department.

Query - select employee. Department_id from employees_vu;

5. Create a view named DEPT50 that contains the employee number, employee last names and department numbers for all employees in department 50. Label the view columns EMPNO, EMPLOYEE and DEPTNO. Do not allow an employee to be reassigned to another department through the view.

Query – create view dept 50 as select employee_id emp_no, last_name employee, department_id dept_no from employees where department_id = 50 with check option constraint emp_dept=50;

6. Display the structure and contents of the DEPT50 view.

Query – describe dept50

Select * from dept50;

7. Attempt to reassign Matos to department 80.

Query - update dept50 set deptno = 80 where employee = ‘matos’;

8. Create a view called SALARY_VU based on the employee last names, department names, salaries, and salary grades for all employees. Use the Employees, DEPARTMENTS and JOB_GRADE tables. Label the column Employee, Department, salary, and Grade respectively.

Query – create or replace view salary_vu as select e.last_name “employee”, d.department_name “Department”, e.salary “salary” j.grade_level “grades” from employees e, departments d, jobgrades j where e.department_id = d.department_id and e.salary between j.lowest_sal and j.highest_sal;

Ex. No. : **P-6**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Join Clauses

Use the Oracle database for problems 1-6.

1. Join the Oracle database locations and departments table using the location_id column. Limit the results to location 1400 only.

Query - select department_id, department_name, location_id, city from departments JOIN location using (location_id) where location_id = 1400;

2. Join DJs on Demand d_play_list_items, d_track_listings, and d_cds tables with the JOIN USING syntax. Include the song ID, CD number, title, and comments in the output.

Query - select song_id, cd_number, title, comments from d_cals JOIN d_tracks_listings using (cd_number) JOIN d_play_list_items using (song_id);

3. Display the city, department name, location ID, and department ID for departments 10, 20, and 30 for the city of Seattle.

Query - select city, department_name, location_id, department_id from departments JOIN locations using (location_id) where department_id in (10,20,30) and city = 'Seattle' ;

4. Display country name, region ID, and region name for Americas.

Query – select country_name, region_id, region_name from countries JOIN regions using (region_id) where region_name = 'Americas';

5. Write a statement joining the employees and jobs tables. Display the first and last names, hire date, job id, job title, and maximum salary. Limit the query to those employees who are in jobs that can earn more than \$12,000.

Query – select country_name, last_name, hire_date, job_id, job_title, max_salary from employees JOIN jobs using (job_id) where max_salary>12000;

Inner versus Outer Joins

Use the Oracle database for problems 1-7.

1. Return the first name, last name, and department name for all employees including those employees not assigned to a department.

Query – select emp.first_name “first_name”, emp.last_name “last_name”, dpt department_name “department name” from employees emp left outer join departments dept on emp.department_id = department_id;

2. Return the first name, last name, and department name for all employees including those departments that do not have an employee assigned to them.

Query - select emp.first_name “first_name”, emp.last_name “last_name”, dpt department_name “department name” from employees emp right outer join departments dept on emp.department_id = department_id;

3. Return the first name, last name, and department name for all employees including those departments that do not have an employee assigned to them and those employees not assigned to a department.

Query - select emp.first_name “first_name”, emp.last_name “last_name”, dpt department_name “department name” from employees emp full outer join departments dept on emp.department_id = department_id;

4. Create a query of the DJs on Demand database to return the first name, last name, event date, and description of the event the client held. Include all the clients even if they have not had an event scheduled.

Query – select first_name, ct.last_name, ev.event_date, ev.description from d_clients ct left outer join d_events ev on ct.client_number = cv.client_number;

5. Using the Global Fast Foods database, show the shift description and shift assignment date even if there is no date assigned for each shift description.

Query – select f_shifts.description “shift description”, f_shift_assignments.shift_assign_date as “shifts assignment date” from f_shifts left outer join f_shifts_assignments on f_shifts_code = f_shifts_assignment.code;

Self Joins and Hierarchical Queries

For each problem, use the Oracle database.

1. Display the employee's last name and employee number along with the manager's last name and manager number. Label the columns: Employee, Emp#, Manager, and Mgr#, respectively.

Query - select e.last_name as "employees", e.employee_id as "emp#", m.last_name as "manager", m.employee_id as "mgr#" from employees e join employees on (e.manager_id = m.employee_id);

2. Modify question 1 to display all employees and their managers, even if the employee does not have a manager. Order the list alphabetically by the last name of the employee.

Query - select e.last_name as "employees", e.employee_id as "emp#", m.last_name as "manager", m.employee_id as "mgr#" from employees e left join employees on e.manager_id = m.employee_id order by e.last_name;

3. Display the names and hire dates for all employees who were hired before their managers, along with their managers' names and hire dates. Label the columns Employee, Emp Hired, Manager, and Mgr Hired, respectively.

Query - select e.last_name as "employees", e.hire_date as "emp hired", m.last_name as "manager", m.hiredate as "mgr hired" from employees e join employees m on e.manager_id = e.employee_id and e.hire_date < m.hire_date;

4. Write a report that shows the hierarchy for Lex De Haans department. Include last name, salary, and department id in the report.

Query - select last_name, department_id, salary from employees start with last_name = 'De Haan' connect by prior employee_id = manager_id;

5. What is wrong in the following statement:

```
SELECT last_name, department_id, salary
```

```
FROM employees
```

```
START WITH last_name = 'King'
```

```
CONNECT BY PRIOR manager_id = employee_id;
```

Solution - the statement has manager and employee ID reversed in the connect by prior clause. If executed, it will only display king and none of the other employees.

Oracle Equijoin and Cartesian Product

1. Create a Cartesian product that displays the columns in the d_play_list_items and the d_track_listings in the DJs on Demand database.

Query - select * from d_play_list_items, d_track_listings;

2. Correct the Cartesian product produced in question 1 by creating an equijoin using a common column.

Query - select * from d_play_list_items JOIN d_track_listings on d_play_list_items.track_id = d.track_listings.track_id;

3. Write a query to display the title, type, description, and artist from the DJs on Demand database.

Query - select d_songs.title, d_songs.types.code_type, d_types.description from d_songs.d_types.code and d_songs, d_types where d.songs.type_code = d_types.code.

4. Rewrite the query in question 3 to select only those titles with an ID of 47 or 48.

Query - select d_songs.title, d_songs.type_code, d_types.description from d_songs.d_types where d.songs.type_code = d_types.code and d_songs.id in (47,48);

5. Write a query that extracts information from three tables in the DJs on Demand database, the d_clients table, the d_events table, and the d_job_assignments table.

Query - select c.client_id, c.client_name, e.event_id, e.event_name, e.event_date, ja.job_id, ja.job_description from d.clients JOIN d_job_assignments ja on c.clients_id = ja.clients_id JOIN d_events e on ja.event_id = e.event_id;

Group Functions

1. Define and give an example of the seven group functions: AVG, COUNT, MAX, MIN, STDDEV, SUM, and VARIANCE.

Query - select min(salary), max(salary), avg(salary), sum(salary), round(variance(salary),2), round (STDDEV (salary), 2), count(salary) from employees;

2. Create a query that will show the average cost of the DJs on Demand events. Round to two decimal places.

Query – select round (avg(cost),2) as “Average cost” from d_events;

3. Find the average salary for Global Fast Foods staff members whose manager ID is 19.

Query – select to_char(round(avg(salary),2), '\$999999.99') as “Average salary” from f_staffs where manager_id = 19;

4. Find the sum of the salaries for Global Fast Foods staff members whose IDs are 12 and 9.

Query - select to_clean (round(sum(salary),12), '\$999999.99') as “Total salary” from f_staffs where id in (12,19);

5. Your new Internet business has had a good year financially. You have had 1,289 orders this year. Your customer order table has a column named total_sales. If you submit the following query, how many rows will be returned?

SELECT sum(total_sales) fFROM orders;

Solution - single row is return

6. You were asked to create a report of the average salaries for all employees in each division of the company. Some employees in your company are paid hourly instead of by salary. When you ran the report, it seemed as though the averages were not what you expected—they were much higher than you thought! What could have been the cause?

Query – select (avg(nullif(salary,hourly_rate * has_worked_in_yr)))

This way the null fields ignored will also be counted.

7. Employees of Global Fast Foods have birth dates of July 1, 1980, March 19, 1979, and March 30, 1969. If you select MIN(birthdate), which date will be returned?

Solution - march 30, 1969

8. Create a query that will return the average order total for all Global Fast Foods orders from January 1, 2002, to December 21, 2002.

Query - select ‘Average of’ || (count (order_number) || ‘ordersin : || Avg (NULL(order _total 10)) as “Average from f_orders where order_date between to_date (‘January’, ‘2002, “fn month DD,YYYY’) AND to_date (‘December 21 2002’ ‘fm month DD, YYYY);

9. What was the hire date of the last Oracle employee hired?

Query – select max(hire_date) as “the last” from employees;

10. Your new Internet business has had a good year financially. You have had 1,289 orders this year. Your customer order table has a column named total_sales. If you submit the following query, how many rows will be returned?

SELECT sum(total_sales)

FROM orders;

Solution – the query will return 1 row.

Ex. No. : **P-7**

Register No.: **221701002**

Name: **P Abhignya**

COUNT, DISTINCT, NVL

1. How many songs are listed in the DJs on Demand D_SONGS table?

Query - select count(song_id) as total_songs from d_songs;

2. In how many different location types has DJs on Demand had venues?

Query – select count(distinct location_type) as different_location_types from venues;

3. The d_track_listings table in the DJs on Demand database has a song_id column and a cd_number column. How many song IDs are in the table and how many different CD numbers are in the table?

Query - select count(distinct song_id) as unique_song_ids, count(distinct id_number) as different_cd_numbers from d_track_listings;

4. How many of the DJs on Demand customers have email addresses?

Query – select count(email) as customers_with_emails from customers;

5. Some of the partners in DJs on Demand do not have authorized expense amounts (auth_expense_amt). How many partners do have this privilege?

Query – select count(auth_expense_amt) as partners_with_expense_auth from partners;

6. What values will be returned when the statement below is issued?

ID	type	shoe_color
456	oxford	brown
463	sandal	tan
262	heel	black

433	slipper	tan
-----	---------	-----

SELECT COUNT(shoe_color),
 COUNT(DISTINCT shoe_color)
 FROM shoes;

Query – select count (shoe_color) as total_shoe_colors, count(distinct_shoes_colour) as distinct_shoes_colors from shoes;

7. Create a query that will convert any null values in the auth_expense_amt column on the DJs on Demand D_PARTNERS table to 100000 and find the average of the values in this column. Round the result to two decimal places.

Query - select round(avg(NULL(auth_expense_amt, 100000)),2) as average_expense_amt from d_partners;

8. Which of the following statements is/are TRUE about the following query?

SELECT AVG(NVL(selling_bonus, 0.10))
 FROM bonuses;

False a. The datatypes of the values in the NVL clause can be any datatype except date data.

True b. If the selling_bonus column has a null value, 0.10 will be substituted.

False c. There will be no null values in the selling_bonus column when the average is calculated.

False d. This statement will cause an error. There cannot be two functions in the SELECT statement.

9. Which of the following statements is/are TRUE about the following query?

SELECT DISTINCT colors, sizes
 FROM items;

True a. Each color will appear only once in the results set.

False b. Each size will appear only once in the results set.

False c. Unique combinations of color and size will appear only once in the results set.

False d. Each color and size combination will appear more than once in the results set.

Using GROUP BY and HAVING Clauses

1. In the SQL query shown below, which of the following are true about this query?
 - a. Kimberly Grant would not appear in the results set.
 - b. The GROUP BY clause has an error because the manager_id is not listed in the SELECT clause.
 - c. Only salaries greater than 16001 will be in the result set.
 - d. Names beginning with Ki will appear after names beginning with Ko.
 - e. Last names such as King and Kochhar will be returned even if they don't have salaries > 16000.

```
SELECT last_name, MAX(salary)
```

```
FROM employees
```

```
WHERE last_name LIKE 'K%'
```

```
GROUP BY manager_id, last_name
```

```
HAVING MAX(salary) > 16000
```

```
ORDER BY last_name DESC ;
```

2. Each of the following SQL queries has an error. Find the error and correct it. Use Oracle Application Express to verify that your corrections produce the desired results.

```
a. SELECT manager_id
```

```
FROM employees
```

```
WHERE AVG(salary) < 16000
```

```
GROUP BY manager_id;
```

Query - avg (salary)

```
b. SELECT cd_number, COUNT(title)
```

```
FROM d_cds
```

```
WHERE cd_number < 93;
```

Query – select count(*) from d_cols where cd_number < 93;

```
c. SELECT ID, MAX(ID), artist AS Artist FROM d_songs
```

```
WHERE duration IN('3 min', '6 min', '10 min')
```

```
HAVING ID < 50
```

```
GROUP by ID;
```

Query – select ID, max (ID) as max_ID, artist as from d_songs where duration in ('3min', '6min',

'10min', and ID<50 group by ID;

d. SELECT loc_type, rental_fee AS Fee
FROM d_venues
WHERE id <100
GROUP BY "Fee"
ORDER BY 2;

Query – select loc_type, rental_fee as fee from d_venues where id<100 group by loc_type, rented fee order by rental_fee;

3. Rewrite the following query to accomplish the same result:

```
SELECT DISTINCT MAX(song_id)  
FROM d_track_listings  
WHERE track IN ( 1, 2, 3);
```

Query - select track, max(song_id) from d_track_listings where track in (1,2,3) group by track;

4. Indicate True or False

- a. If you include a group function and any other individual columns in a SELECT clause, then each individual column must also appear in the GROUP BY clause. - **True**
- b. You can use a column alias in the GROUP BY clause. - **False**
- c. The GROUP BY clause always includes a group function. - **False**

5. Write a query that will return both the maximum and minimum average salary grouped by department from the employees table.

Query – select department_id, max(avg(salary)) as max_salary, min(avg(salary)) as min_avg_salary from employees group by department_id;

6. Write a query that will return the average of the maximum salaries in each department for the employees table.

Query – select avg(max(salary)) from employees group by department_id;

Using Set Operators

1. Name the different Set operators?

Query – union, union all, minus and intersect

2. Write one query to return the employee_id, job_id, hire_date, and department_id of all employees and a second query listing employee_id, job_id, start_date, and department_id from the job_history table and combine the results as one single output. Make sure you suppress duplicates in the output.

Query – select employee_id, job_id, hire_date, department_id, from employees union select employee_id, job_id, start_date, department_id from job_history order by employee_id, hire_date;

3. Amend the previous statement to not suppress duplicates and examine the output. How many extra rows did you get returned and which were they? Sort the output by employee_id to make it easier to spot.

Query - select employee_id, job_id, hire_date, department_id from employees union all select employee_id, job_id, start_date, department_id from job_history order by employee_id, hire_date;

4. List all employees who have not changed jobs even once. (Such employees are not found in the job_history table)

Query – select distinct employee_id from employees minus select distinct employee_id from job_history;

5. List the employees that HAVE changed their jobs at least once.

Query - select distinct employee_id from employees intersect select distinct employee_id from job_history;

6. Using the UNION operator, write a query that displays the employee_id, job_id, and salary of ALL present and past employees. If a salary is not found, then just display a 0 (zero) in its place.

Query - select employee_id, job_id, NULL(salary,0) from employees union select employee_id, job_id, 0 from job_history order by employee_id;

Ex. No. : **P-8**

Register No.: **221701002**

Name: **P Abhignya**

Fundamentals of Subqueries

1. What is the purpose of using a subquery?

Solution – to find the intermediate information we need to extract information we want, eg – extracting right part is where | having | from clause.

2. What is a subquery?

Solution – an inner query that is nested within an outer query.

3. What DJs on Demand d_play_list_items song_id's have the same event_id as song_id 45?

Query- select song_id from d_play_list_items where event_id in (select event_id from d_play_list_items where song_id = 45);

4. Which events in the DJs on Demand database cost more than event_id = 100?

Query- select id, name from d_events where cost > (select cost from d_events where id = 100);

5. Find the track number of the song that has the same CD number as “Party Music for All Occasions.”

Query- select track from d_track_listings where cd_numbers = (select cd_number from d_cels where title = ‘party music for all occasions’);

6. List the DJs on Demand events whose theme code is the same as the code for “Tropical.”

Query- select id, name from d_events where theme_code = (select code from d_themes where description = ‘Tropical’);

7. What are the names of the Global Fast Foods staff members whose salaries are greater than the staff member whose ID is 12?

Query- select first_name, last_name from f_staffs where salary > (select salary from f_staffs where id = 12);

8. What are the names of the Global Fast Foods staff members whose staff types are not the same as

Bob Miller's?

Query- select first_name, last_name from f_staffs where staff_type != (select staff_type from f_staffs where first_name = 'Bob' and last_name = 'miller');

9. Which Oracle employees have the same department ID as the IT department?

Query- select first_name, last_name from employees where department_id = (select department_id from departments where department_name = 'IT');

10. What are the department names of the Oracle departments that have the same location ID as

Seattle?

Query – select department_name from departments where location_id = (select location_id from locations where city = 'seattle');

11. Which statement(s) regarding subqueries is/are true?

a. It is good programming practice to place a subquery on the right side of the comparison operator.

Solution - True

b. A subquery can reference a table that is not included in the outer query's FROM clause.

Solution - True

c. Single-row subqueries can return multiple values to the outer query.

Solution - False

Single-Row Subqueries

1. Write a query to return all those employees who have a salary greater than that of Lorentz and are in the same department as Abel.

Query – select first_name, last_name from employees where salary > (select salary from employees where last_name = ‘Lorentz’) and department_id = (select department_id from employees where last_name = ‘Abel’);

2. Write a query to return all those employees who have the same job id as Rajs and were hired after Davies.

Query – select first_name, last_name from employees where job_id = (select job_id from employees where last_name = ‘Raja’) and hire_date > (select hire_date from employees where last_name = ‘Davies’);

3. What DJs on Demand events have the same theme code as event ID = 100?

Query – select id, name from d_events where theme_code = (select theme_code from d_events where id = 100);

4. What is the staff type for those Global Fast Foods jobs that have a salary less than those of any Cook staff-type jobs?

Query – select staff_type, max(salary) from f_staffs group by staff_type having max(salary) < (select max(salary) from f_staffs where staff_type = ‘COOK’);

5. Write a query to return a list of department id’s and average salaries where the department’s average salary is greater than Ernst’s salary.

Query – select dept_id, to_char(round(avg(Salary),12), ‘\$999999.99’) “average salary” from employees group by dept_id having avg(salary)>(select sal from emp);

6. Return the department ID and minimum salary of all employees, grouped by department ID, having a minimum salary greater than the minimum salary of those employees whose department ID is not equal to 50.

Query – select department_id, to_char(round(min(salary),2), ‘\$999999.99’) “minimum salary” group by department_id having min(salary) > (select min(salary) from employees where department != 50);

Multiple-Row Subqueries

- What will be returned by a query if it has a subquery that returns a null?

Solution – if a query returns a null, it will be treated as it returned to rows.

- Write a query that returns jazz and pop songs. Write a multi-row subquery and use the d_songs and d_types tables. Include the id, title, duration, and the artist name.

Query – select id, title, duration, artist from d_songs where type_code in (select code from d_types where description in ('Jazz', 'Pop'));

- Find the last names of all employees whose salaries are the same as the minimum salary for any department.

Query – select last_name from employees where salary in select min(salary) from employees group by department_id;

- Which Global Fast Foods employee earns the lowest salary? Hint: You can use either a single- row or a multiple-row subquery.

Query – select last_name from f_staffs where NULL(salary,0) = (select min(Null(salary 20)) from f_staffs);

- Place the correct multiple-row comparison operators in the outer query WHERE clause of each of the following:

- Which CDs in our d_cds collection were produced before “Carpe Diem” was produced?

WHERE year _____ (SELECT year ...)

Query – year is varchar2(4) but results with select * from d_cds where to_number (year) < (select to_number (year) from d_cds where title = ‘Carpe diem’);

- Which employees have salaries lower than any one of the programmers in the IT department?

WHERE salary _____ (SELECT salary ...)

Query – select salart , last_name from employees where salary <and (select salary from employees where department_id = (select department_id from departments where department_name = ‘IT’));

- c. What CD titles were produced in the same year as “Party Music for All Occasions” or “Carpe Diem”?

WHERE year _____(SELECT year ...

Query – select title from d_cds where to_number(year) in (select to_number(year) from d_cds where title IN ('carpe diem', ' party music for all occassions'));

- d. What song title has a duration longer than every type code 77 title?

WHERE duration _____(SELECT duration ...

Query – duration in varchar2(20)

6. If each WHERE clause is from the outer query, which of the following are true?

a. WHERE size > ANY -- If the inner query returns sizes ranging from 8 to 12, the value 9 could be returned in the outer query. **TRUE everyone above 8**

b. WHERE book_number IN -- If the inner query returns books numbered 102, 105, 437, and 225 then 325 could be returned in the outer query. **FALSE**

c. WHERE score <= ALL -- If the inner query returns the scores 89, 98, 65, and 72, then 82 could be returned in the outer query. **FALSE**

d. WHERE color NOT IN -- If the inner query returns red, green, blue, black, and then the outer query could return white. **TRUE**

e. WHERE game_date = ANY -- If the inner query returns 05-Jun-1997, 10-Dec-2002, and 2-Jan-2004, then the outer query could return 10-Sep-2002. **FALSE**

7. The goal of the following query is to display the minimum salary for each department whose minimum salary is less than the lowest salary of the employees in department 50. However, the subquery does not execute because it has five errors. Find them, correct them, and run the query.

```
SELECT department_id  
FROM employees WHERE  
MIN(salary) HAVING  
MIN(salary) > GROUP BY  
department_id SELECT  
MIN(salary)  
WHERE department_id < 50;
```

No data was returned from this query.

Query – select department_id min(salary) from employees group by department_id having min(salary)

((select min(salary) from employees where department_id = 50);

8. Which statements are true about the subquery below?

```
SELECT employee_id, last_name  
FROM employees  
WHERE salary =  
(SELECT MIN(salary)  
FROM employees  
GROUP BY department_id);
```

- a. The inner query could be eliminated simply by changing the WHERE clause to WHERE MIN(salary). **FALSE**
- b. The query wants the names of employees who make the same salary as the smallest salary in any department. **TRUE**
- c. The query first selects the employee ID and last name, and then compares that to the salaries in every department. **FALSE**
- d. This query will not execute.

Solution - true it will not execute. This will require multiple row subquery as in example above.

9. Write a pair-wise subquery listing the last_name, first_name, department_id, and manager_id for all employees that have the same department_id and manager_id as employee 141. Exclude employee 141 from the result set.

Query - select last_name, first_name, department_id, manager_id from employees where (NULL(department_id,-1), NULL(manager_id, -1)) = (select NULL (department_id,-1), NULL(manager_id, -1) from employees where employee_id = 14') and employee_id != 141;

10. Write a non-pair-wise subquery listing the last_name, first_name, department_id, and manager_id for all employees that have the same department_id and manager_id as employee 141.

Query - select last_name, first_name, department_id, manager_id from employees, where NULL (manager_id, -1)) = (select NULL (department_id,-1), from employees where employee_id = 141)

NULL(manager_id, -1) from employees where employee_id = 14') and employee_id != 141;

Correlated Subqueries

1. Explain the main difference between correlated and non-correlated subqueries?

Solution – whether the inner query depends on the outer query non-correlated subquery are independent, while correlated subqueries rely on values from outer query.

2. Write a query that lists the highest earners for each department. Include the last_name, department_id, and the salary for each employee.

Query - select oe.last_name, oe.department_id, oe.salary from employees oe where oe.salary = (select max (iesalary) from employees where NULL (department_id, -1) = NULL(department_id, -1);

3. Examine the following select statement and finish it so that it will return the last_name, department_id, and salary of employees who have at least one person reporting to them. So we are effectively looking for managers only. In the partially written SELECT statement, the WHERE clause will work as it is. It is simply testing for the existence of a row in the subquery.

```
SELECT (enter columns here)
FROM (enter table name here) outer
WHERE 'x' IN (SELECT 'x'
FROM (enter table name here) inner
```

WHERE inner(enter column name here) = inner(enter column name here) Finish off the statement by sorting the rows on the department_id column.

Query - select outer.last_name, outer.department_id, outer_salary from employees outer where outer.employees_id in (select distinct inner.manager_id, outer.employee_id) order by outer.department_id;

4. Using a WITH clause, write a SELECT statement to list the job_title of those jobs whose maximum salary is more than half the maximum salary of the entire company. Name your subquery MAX_CALC_SAL. Name the columns in the result JOB_TITLE and JOB_TOTAL, and sort the result on JOB_TOTAL in descending order.

Hint: Examine the jobs table. You will need to join JOBS and EMPLOYEES to display the job_title.

Query - with max_calc_sal as (select max (max_salary) from jobs)
Select job_title from jobs where jobs.salary > (select * from max_calc_sal);

Summarizing Queries for practice

INSERT Statements

Students should execute DESC tablename before doing INSERT to view the data types for each column. VARCHAR2 data-type entries need single quotation marks in the VALUES statement.

1. Give two examples of why it is important to be able to alter the data in a database.

Solution - data is constantly changing thereafter tables should be altered

- Altering address or phone number for clients in business
- Altering grades for student in a course

2. DJs on Demand just purchased four new CDs. Use an explicit INSERT statement to add each CD to the copy_d_cds table. After completing the entries, execute a SELECT * statement to verify your work.

CD_NUMBER	TITLE	PRODUCER	YEAR
97	Celebrate the Day	R&B Inc.	2003
98	Holiday Tunes for All Ages	Tunes are Us	2004
99	Party Music	Old Town Records	2004
100	Best of Rock and Roll	Old Town Records	2004

Query- select * from copy_D_cos order by cd_number DESC;

3. DJs on Demand has two new events coming up. One event is a fall football party and the other event is a sixties theme party. The DJs on Demand clients requested the songs shown in the table for their events. Add these songs to the copy_d_songs table using an implicit INSERT statement

ID	TITLE	DURATION	TYPE_CODE
52	Surfing Summer	Not known	12
53	Victory Victory	5 min	12

Query – select * from copy_d_songs order by ID DESC;

4. Add the two new clients to the copy_d_clients table. Use either an implicit or an explicit INSERT.

CLIENT_NUMBER	FIRST_NAME	LAST_NAME	PHONE	EMAIL
6655	Ayako	Dahish	3608859030	dahisha@harbor.net
6689	Nick	Neuville	9048953049	nnicky@charter.net

Query - select * from copy_0_clients order by client_number DESC;

5. Add the new client's events to the copy_d_events table. The cost of each event has not been determined at this date.

Query - create copy of main table to play around create table copy_d_events as (select * from d_events);

ID	NAME	EVENT_DATE	DESCRIPTION	COST	VENUE_ID	PACKAGE_CODE	THEME_CODE	CLIENT_NUMBER
110	Ayako Anniversary	07-Jul-2004	Party for 50, sixties dress, decorations	245	79	240	6655	
115	Neuville Sports Banquet	09-Sep-2004	Barbecue at residence, college alumni, 100 people	315	87	340	6689	

b) dec if copy worked well

describe copy_d_events;

describe d_events;

select* from d_events;

select* from copy_d_events;

c) Verify data

Select * from copy_d_events;

6. Create a table called rep_email using the following statement:

```
CREATE TABLE rep_email ( id NUMBER(3) CONSTRAINT rel_id_pk PRIMARY KEY, first_name  
VARCHAR2(10), last_name VARCHAR2(10), email_address VARCHAR2(10))
```

Populate this table by running a query on the employees table that includes only those employees who are REP's.

Query – alter table rep_email drop column_id;

```
Alter table rep_email add id number (6,0) constrain rel_id_pk primary key;
```

```
Insert into rep_email(id,first_name, last_name, email, address)
```

```
Select employee_id, first_name, last_name, email from employees where job_id like '%\_rep' 'escape'\';
```

P Abhignya - 221701002

Updating Column Values and Deleting Rows

NOTE: Copy tables in this section do not yet exist; students must create them.

If any change is not possible, give an explanation as to why it is not possible.

- Monique Tuttle, the manager of Global Fast Foods, sent a memo requesting an immediate change in prices. The price for a strawberry shake will be raised from \$3.59 to \$3.75, and the price for fries will increase to \$1.20. Make these changes to the copy_f_food_items table.

Query – update copy_f_food_items set price = ‘3.75’ where food_item_number = 93;

Update copy_f_food_items set price = ‘1.20’ where food_item_number = 90;

- Bob Miller and Sue Doe have been outstanding employees at Global Fast Foods. Management has decided to reward them by increasing their overtime pay. Bob Miller will receive an additional \$0.75 per hour and Sue Doe will receive an additional \$0.85 per hour. Update the copy_f_staffs table to show these new values. (Note: Bob Miller currently doesn’t get overtime pay. What function do you need to use to convert a null value to 0?)

Query - update copy_f_staffs set overtime_rate = NULL (over_time_rate, 0) + 0.75 where lower (first_name || ‘ ’ || last_name) = ‘Bob Miller’ ;

Update copy_f_staffs set overtime_rate = NULL (overtime_rate, 0) + 0.85 where lower (first_name || ‘ ’ || last_name) ‘sue doe’ ;

Select * from copy_f_staffs

3. Add the orders shown to the Global Fast Foods copy_f_orders table:

ORDER_NUMB ER	ORDER_DAT E	ORDER_TOT AL	CUST_ID	STAFF_ID
5680	June 12, 2004	159.78	145	9
5691	09-23-2004	145.98	225	12
5701	July 4, 2004	229.31	230	12

Query -

```
Insert into copy_f_orders Values (5680,'12-Jun-2004', 159.78, 145,9);
Insert into copy-f-orders values (5691,'23-Sep-2004', 145.98,225,12);
Insert into copy_f_orders values(5701, '04-Jul-2004', 229.3, 230, 12);
```

4. Add the new customers shown below to the copy_f_customers table. You may already have added Katie Hernandez. Will you be able to add all these records successfully?

ID	FIRS T_ NAM E	LAST_ NAME	ADDRES S	CITY	STAT E	ZIP	PHONE_NUMB ER
145	Katie	Hernandez	92 Chico Way	Los Angeles	CA	98008	8586667641
225	Daniel	Spode	1923 Silverado	Denver	CO	80219	7193343523
230	Adam	Zurn	5 Admiral Way	Seattle	WA		4258879009

Insert into copy_f_customers (id, first n_name, last _name, address, city, state, zip, phone_number)values (145, 'katie',

‘Hernandez’, 192 chico way, ‘Los Angeles’, ‘CA’98008, ‘8586667641’);

5. Sue Doe has been an outstanding Global Foods staff member and has been given a salary raise. She will now be paid the same as Bob Miller. Update her record in copy_f_staffs.

Update copy_f_staffs set salary= (select salary from copy_f_staffs where id=9)

Where id=12'

6. Global Fast Foods is expanding their staff. The manager, Monique Tuttle, has hired Kai Kim. Not all information is available at this time, but add the information shown at right.

ID	FIRST_NA ME	LAST_NA ME	BIRTHDAT E	SALARY	STAFF TYPE
25	Kai	Kim	3-Nov-1988	6.75	Order Taker

Insert into copy_f_staffs values (25, ‘kai’, ‘kim’, ’03-Nov-1988’, 6.75, “”, ‘order Taker’, “ ”);

7. Now that all the information is available for Kai Kim, update his Global Fast Foods record to include the following: Kai will have the same manager as Sue Doe. He does not qualify for overtime. Leave the values for training, manager budget, and manager target as null.

Update copy_f_staffs set manager_id=(select manager_id from copy_f_staffs where id=12)

Where id = 25;

8. Execute the following SQL statement. Record your results.

DELETE from departments

WHERE department_id = 60;

ORA-02292: integrity constraint (MKUMAR_EMP_dept_fk) violated_child record found

9. Kim Kai has decided to go back to college and does not have the time to work and go to school.

Delete him from the Global Fast Foods staff. Verify that the change was made.

Delete from copy_f_staffs where id=25;

10. Create a copy of the employees table and call it lesson7_emp;

Once this table exists, write a correlated delete statement that will delete any employees from the lesson7_employees table that also exist in the job_history table.

Create table lesson 7_emp on (select * from employees);

Delete from lesson 7_emp where employee_id in (Select distinct employee_id from job_history);

DEFAULT Values, MERGE, and Multi-Table Inserts

- When would you want a DEFAULT value?

When data is not provided for the row.

- Currently, the Global Foods F_PROMOTIONAL_MENU table START_DATE column does not have SYSDATE set as DEFAULT. Your manager has decided she would like to be able to set the starting date of promotions to the current day for some entries. This will require three steps:

- In your schema, Make a copy of the Global Foods F_PROMOTIONAL_MENU table using the following SQL statement:

```
Create table copy_f_promotional_menus as (Select * from f_promotional_menus);
```

- Alter the current START_DATE column attributes using:

```
Alter table copy_f_promotional_menus modify (start_date date default Trunc(sysdate));
```

- INSERT the new information and check to verify the results.

INSERT a new row into the copy_f_promotional_menus table for the manager's new promotion. The promotion code is 120. The name of the promotion is 'New Customer.' Enter DEFAULT for the start date and '01-Jun-2005' for the ending date. The giveaway is a 10% discount coupon. What was the correct syntax used?

```
Insert into copy_f_promotional_menus (code, name, start-date, end-date, five-away) values ('115', 'Back_to_school part 2', Default, new, 'ball pen and highlighter again');
```

- Allison Plumb, the event planning manager for DJs on Demand, has just given you the following list of CDs she acquired from a company going out of business. She wants a new updated list of CDs in inventory in an hour, but she doesn't want the original D_CDS table changed. Prepare an updated inventory list just for her.

- Assign new cd_numbers to each new CD acquired.

This cd_number assignment is done manually. I need not create sequence for this.

- Create a copy of the D_CDS table called manager_copy_d_cds. What was the correct syntax used?

```
Create table manager_copy_d_cds as (select * from d_cds)
```

- INSERT into the manager_copy_d_cds table each new CD title using an INSERT statement. Make up one example or use this data:

```
Insert into manager_copy_d_cds values (20, 'Hello', 'Here I am', 'middle earth records', '1988');  
20, 'Hello World Here I Am', 'Middle Earth Records', '1998' What  
was the correct syntax used?
```

Insert into manager_copy_d_cds (cd_number, title, year) values (20, 'Hello world Here I am ', 'middle earth records', '1988');

d. Use a merge statement to add to the manager_copy_d_cds table, the CDs from the original table. If there is a match, update the title and year. If not, insert the data from the original table. What was the correct syntax used?

Merge into manager_copy_d_cds tgt, cd_number)

4. Run the following 3 statements to create 3 new tables for use in a Multi-table insert statement. All 3 tables should be empty on creation, hence the WHERE 1=2 condition in the WHERE clause.

```
CREATE TABLE sal_history (employee_id, hire_date, salary) AS
```

```
SELECT employee_id, hire_date, salary
```

```
FROM employees
```

```
WHERE 1=2;
```

```
CREATE TABLE mgr_history (employee_id, manager_id, salary)
```

```
AS SELECT employee_id, manager_id, salary
```

```
FROM employees
```

```
WHERE 1=2;
```

```
CREATE TABLE special_sal (employee_id, salary)
```

```
AS SELECT employee_id, salary
```

```
FROM employees
```

```
WHERE 1=2;
```

Once the tables exist in your account, write a Multi-Table insert statement to first select the employee_id, hire_date, salary, and manager_id of all employees. If the salary is more than 20000 insert the employee_id and salary into the special_sal table. Insert the details of employee_id, hire_date, and salary into the sal_history table. Insert the employee_id, manager_id, and salary into the mgr_history table.

You should get a message back saying 39 rows were inserted. Verify you get this message and verify you have the following number of rows in each table:

Sal_history: 19 rows

Mgr_history: 19 rows

Special_sal: 1

Insert first where salary>2000 then into special_sal Values (employee_id, salary) else into sal_history values (employee_id, hire_date, salary) into mgr_history values (employee_id, manager_id, salary)

Creating Tables

1. Complete the GRADUATE CANDIDATE table instance chart. Credits is a foreign-key column referencing the requirements table.

Column name	student_id	last_name	first_name	credits	graduation_date	key	Type
Primary Key	No/No	Foreign key	Null/unique	No/yes	No/No		
Varchar 2	No/No	Yes/No	Data Type	Number 6	Varchar 2		
Number 6	Date						

```
Create table graduate_candidates (student_id number (6,0), last_name varchar 2 (75)
constraint get_last_name_on Not null enable, first_name Varchar2(75) constraints get_first_name_mn
NOT NULL enable
```

2. Write the syntax to create the grad_candidates table.

```
Describe graduate_candidates;
```

3. Confirm creation of the table using DESCRIBE.

```
Create table kumar_table (student_id, last_name, first_name, credits, graduation_date), values (10,
‘kumar’, ‘he’, 999.99, Null);
```

4. Create a new table using a subquery. Name the new table your last name – e.g., smith_table. Using a subquery, copy grad_candidates into smith_table.

```
Create table kumar_table (student_id, last_name, first_name, credits, graduation_date) values (10, ‘kumar’,
‘he’, 999.99 Null);
```

5. Insert your personal data into the table created in question 4.

Insert into Kumar_table (student_id, last_name, first_name, credits, graduation_date) values (10, 'kumar', 'he', 999.99, Null);

6. Query the data dictionary for each of the following:

- USER_TABLES
- USER_OBJECTS
- USER_CATALOG or USER_CAT

In separate sentences, summarize what each query will return.

Select * from user_tables;

Select * from user_objects;

Select * from user_catalogue;

Modifying a Table

Before beginning the practice exercises, execute a DESCRIBE for each of the following tables: o_employees and o_jobs. These tables will be used in the exercises. You will need to know which columns do not allow null values.

NOTE: If students have not already created the o_employees, o_departments, and o_jobs tables they should create them using the four steps outlined in the practice.

1. Create the three o_tables – jobs, employees, and departments – using the syntax:

Create table o_jobs on (select * from jobs);

Create table o_employees or (select * from employees);

2. Add the Human Resources job to the jobs table:

Insert into o_jobs (job_id, job_title, min_salary, max_salary) value ('HR_man', 'Human resource manager', 4500, 5500);

3. Add the three new employees to the employees table:

Insert into o_employees (user_id, f_name, l_name, email, h_data, j_id) Values (210, 'Ramon', 'Sanchez', RSANCHEZ.sysdate, 'HR_Man')

4. Add Human Resources to the departments table:

Insert into o_departments (department_id, department_name) values (210, 'Human resources');

5. Why is it important to be able to modify a table?

There is nothing permanent in this world except change and I do make mistakes, that is database are also dynamic in nature. So the tables could be modified

1. CREATE a table called Artists.: Create table artist (artist_id_number(510), first_name

a. Add the following to the table:

- artist ID Varchar 2(25) constraint art_first_name not null enable, last_name
- first name Varchar (25) constraint art_last_name_nn not null enable, Card_name
- last name Varchar (30), email varchar (25) constraint email_not null
- band name enable, hr_mate number (812) constraint oil_hi-gite mm not
- email null enable, song_id number (510) constraint out song_id_nn
- hourly rate
- song ID from d_songs table not null enable constraint ait_rd_pk primary key (orbit_id);

b. INSERT one artist from the d_songs table.

c. INSERT one artist of your own choosing; leave song_id blank.

d. Give an example how each of the following may be used on the table that you have created:

1) ALTER TABLE

2) DROP TABLE

3) RENAME TABLE

4) TRUNCATE

5) COMMENT ON TABLE

a. Explain to students how you want the DJs on Demand artist's table assignment to be completed. Students should be able to list the term followed by the SQL statement they used. For example:

2. In your o_employees table, enter a new column called "Termination." The datatype for the new column should be VARCHAR2. Set the DEFAULT for this column as SYSDATE to appear as character data in the format: February 20th, 2003.

```
Alter table o_employees add("Termination" varchar2 (200) default tochar (sysdate:'month_date, yyyy'));
```

3. Create a new column in the o_employees table called start_date. Use the TIMESTAMP WITH LOCAL TIME ZONE as the datatype.

```
Alter table o_employees add (start_date timestamp with time zone)
```

4. Truncate the o_jobs table. Then do a SELECT * statement. Are the columns still there? Is the data still there?

```
Select * from o_jobs'
```

```
Truncate table o_jobs;
```

```
Describe o_jobs;
```

```
Select * from o_jobs;
```

5. What is the distinction between TRUNCATE, DELETE, and DROP for tables?

Truncate empty table data DDL

Drop delete table from database DDL

Delete record from table DML

6. List the changes that can and cannot be made to a column.

a. Can measure precision of number, length of characters

b. Can decrease precision of numbers only if data are null length character to largest character in table

7. Add the following comment to the o_jobs table:

"New job description added"

View the data dictionary to view your comments.

Comment on table o_jobs is 'New job description is added';

Select table_name, comments from user_tab comments where lower (table_name) = ‘o_jobs’;

8. Rename the o_jobs table to o_job_description.

Alter table o_jobs;

Rename to o_job description;

Rename o_job_description to o_job_description 2

9.F_staffs table exercises:

A. Create a copy of the f_staffs table called copy_f_staffs and use this copy table for the remaining labs in this lesson.

Create table copy_f_staffs on (select*from f_staffs);

Describe f_staffs;

Describe copy_f_staffs

P Abhignya - 221701002

B.Describe the new table to make sure it exists.

```
Desc copy_f_staffs;
```

C.Drop the table.

```
Drop table copy_f_staffs;
```

D.Try to select from the table.

```
Select *from copy_f_staffs;
```

E.Investigate your recyclebin to see where the table went.

```
Select object_name from user_recyclebin where lower(original_name) = 'copy_f_staffs' and droptime=2016-11-02 20:14:25');
```

a. Try to select from the dropped table by using the value stored in the OBJECT_NAME column. You will need to copy and paste the name as it is exactly, and enclose the new name in “ “ (double quotes). So if the dropped name returned to you is BIN\$Q+x1nJdcUnngQESYELVIdQ==\$0, you need to write a query that refers to “BIN\$Q+x1nJdcUnngQESYELVIdQ==\$0”.

```
Select* from "BIN$9+x1nJdcUnngQESYELV1dq==$O";
```

b. Undrop the table.

```
Flsback table copy_f_staffs to before drop;
```

c. Describe the table.

```
Describe copy_f_staffs;
```

11. Still working with the copy_f_staffs table, perform an update on the table.

- a. Issue a select statement to see all rows and all columns from the copy_f_staffs table;

Select*from copy_of_staffs;

- b. Change the salary for Sue Doe to 12 and commit the change.

Update copy_f_staffs set salary=12 where first_name = ‘sue’ and last_name = ‘Doe’ .

- c. Issue a select statement to see all rows and all columns from the copy_f_staffs table;

Select *from copy_f_staffs;

- d. For Sue Doe, update the salary to 2 and commit the change.

Update copy_f_staffs set salary=2 where first_name = ‘sue’ and last_name =’Doe’;

- e. Issue a select statement to see all rows and all columns from the copy_f_staffs table;

Select *from copy_f_staffs;

- f. Now, issue a FLASHBACK QUERY statement against the copy_f_staffs table, so you can see all the changes made.

Select *from copy_f_staffs version between set min_value and max_value where id:12);

g. Investigate the result of f), and find the original salary and update the copy_f_staffs table salary column for Sue Doe back to her original salary.

Update copy_f_staffs set salary=(select salary from copy_f_staffs version between set min_value and max_value where first_name ‘sue’ and last_name = ‘Doe’ and version operation in null and version_staff_time in null) where first_name = ‘sue’ and last_name = ‘Doe’.

P Abhignya - 221701002

Ex. No. : 14

Date:

Register No.: 221701002

Name: P Abhignya

Intro to Constraints; NOT NULL and UNIQUE Constraints

Global Fast Foods has been very successful this past year and has opened several new stores. They need to add a table to their database to store information about each of their store's locations. The owners want to make sure that all entries have an identification number, date opened, address, and city and that no other entry in the table can have the same email address. Based on this information, answer the following questions about the global_locations table. Use the table for your answers.

Global Fast Foods global_locations Table						
NAME	TYPE	LENGTH	PRECISION	SCALE	NULLABLE	DEFAULT
Id	Pk_number	6	0		No	
name	Varchar	50			Yes	
date_opened	Date				No	
address	Varchar	100			No	
city	Varchar	30			Yes	
zip/postal code	Varchar	10			Yes	
phone	Varchar	20			Yes	
email	Varchar	750			Yes	
manager_id	Fir number	6	0		Yes	

Emergency contact	Varchar	20			Yes	
-------------------	---------	----	--	--	-----	--

1. What is a “constraint” as it relates to data integrity?

Rule to maintain data integrity, primary key constraint, foreign key const, unique check, not null

2. What are the limitations of constraints that may be applied at the column level and at the table level?

Constraing referring, more column are defined at table level

3. Why is it important to give meaningful names to constraints?

- a. Easy to update
- b. Easy to find error

4. Based on the information provided by the owners, choose a datatype for each column. Indicate the length, precision, and scale for each NUMBER datatype.

Refer table above

5. Use “(nullable)” to indicate those columns that can have null values.

Refer table above

6. Write the CREATE TABLE statement for the Global Fast Foods locations table to define the constraints at the column level.

```
Create table g-fastf, loc (int id, constraining 'fast_food' primary key name varchar/50)not null, address varchar (100) not null, city varchar (30) not null, postal code varchar (10), phone int, email varchar (100), ng_id int, ang int);
```

7. Execute the CREATE TABLE statement in Oracle Application Express.

Table created

8. Execute a DESCRIBE command to view the Table Summary information.

Describe f_global_location;

9. Rewrite the CREATE TABLE statement for the Global Fast Foods locations table to define the UNIQUE constraints at the table level. Do not execute this statement.

NAME	TYPE	LENGTH	PRECISION	SCALE	NULLABLE	DEFAULT
id	number	4				
loc_name	varchar2	20			X	
	date					
address	varchar2	30				
city	varchar2	20				
zip_postal	varchar2	20			X	
phone	varchar2	15			X	
email	varchar2	80			X	
manager_id	number	4			X	
contact	varchar2	40			X	

Create table g_fast_lor (id int primary key, name varchar (50), address varchar 2/50) not null, city varchar (2), postal_code varchar 2(20), phone number (15), my_id int, contact varchar (40), constraint fast_10 (email) unique (email);

PRIMARY KEY, FOREIGN KEY, and CHECK Constraints

1. What is the purpose of a
 - PRIMARY KEY - uniquely identify each row in table
 - FOREIGN KEY - Operational integrity constraint links prevent table
 - CHECK CONSTRAINT – Unique key to child table column explicitly define condition to be met by each row yields.

Condition must be returned on true or unknown.

2. Using the column information for the animals table below, name constraints where applicable at the table level, otherwise name them at the column level. Define the primary key (animal_id). The license_tag_number must be unique. The admit_date and vaccination_date columns cannot contain null values.

animal_id NUMBER(6) - Primary Key
name VARCHAR2(25)
license_tag_number NUMBER(10) - Unique
admit_date DATE
adoption_id NUMBER(5), -not null
vaccination_date DATE – not null

3. Create the animals table. Write the syntax you will use to create the table.

```
Create table animals (ani_id number (60) constrains primary key, name varchar license_key number (1000). Constraint_1_tag_num unique admit_date date constraint on not null enable.  
Adapter_id_num(50)_Validation_date date constraint_vce_null enable);
```

4. Enter one row into the table. Execute a SELECT * statement to verify your input. Refer to the graphic below for input.

ANIMAL_ID	NAME	LICENSE_TAG_NUM BER	ADMIT_DATE	ADOPTION_ID	VACCINATION_DATE
101	Spot	35540	10-Oct-2004	205	12-Oct-2004

Insert into animals (animal_id, name, license_tag_number, admit_close, adoption_id, vaccination_date) values (101, 'spot', 3554 to_date ('10-01-2004', 'DD_mm_yyyy'), 205, Todate (12-0402004, 'DD_mm_yyyy'));

5. Write the syntax to create a foreign key (adoption_id) in the animals table that has a corresponding primary-key reference in the adoptions table. Show both the column-level and table-level syntax. Note that because you have not actually created an adoptions table, no adoption_id primary key exists, so the foreign key cannot be added to the animals table.

Column level. Alter table animal modify(adopt_id number (5,6), constraint adop_id reference adoption (id) email) table level.

After table animals add constraint adpt_id key (adopt_id) references_adoption (id) enables;

6. What is the effect of setting the foreign key in the ANIMAL table as:

- a. ON DELETE CASCADE -> will delete child table's data also
- b. ON DELETE SET NULL -> will set null to the specific column referenced

7. What are the restrictions on defining a CHECK constraint?

- Cannot call over defined function
- Cannot use sub queries

PRACTICE PROBLEM

Managing Constraints

Using Oracle Application Express, click the SQL Workshop tab in the menu bar. Click the Object Browser and verify that you have a table named copy_d_clients and a table named copy_d_events. If you don't have these tables in your schema, create them before completing the exercises below. Here is how the original tables are related. The d_clients table has a primary key client_number. This has a primary-key constraint and it is referenced in the foreign-key constraint on the d_events table.

NOTE: The practice exercises use the d_clients and d_events tables in the DJs on Demand database. Students will work with copies of these two tables named copy_d_clients and copy_d_events. Make sure they have new copies of the tables (without changes made from previous exercises). Remember, tables copied using a subquery do not have the integrity constraints as established in the original tables. When using the SELECT statement to view the constraint name, the tablename must be all capital letters.

1. What are four functions that an ALTER statement can perform on constraints?

Add enable

Drop disable

2. Since the tables are copies of the original tables, the integrity rules are not passed onto the new tables; only the column datatype definitions remain. You will need to add a PRIMARY KEY constraint to the copy_d_clients table. Name the primary key copy_d_clients_pk . What is the syntax you used to create the PRIMARY KEY constraint to the copy_d_clients.table?

Alter table copy_d_clients add constraint copy_d_cl
Client_number pk primary key (client_number)

3. Create a FOREIGN KEY constraint in the copy_d_events table. Name the foreign key copy_d_events_fk. This key references the copy_d_clients table client_number column. What is the syntax you used to create the FOREIGN KEY constraint in the copy_d_events table?

Alter table copy_d_events add constraint copy_d_eve_client number
 Foreign key (client_number)reference copy_d_clients (client number) enable;

4. Use a SELECT statement to verify the constraint names for each of the tables. Note that the tablenames must be capitalized.

Select constraint_name, constraint_type table_name to constraint where table_name = upper ((copy of _events))

- a. The constraint name for the primary key in the copy_d_clients table is_____.

Copy_d_dt_client
 Number_pk

5. Drop the PRIMARY KEY constraint on the copy_d_clients table. Explain your results.

This unique primary key is referenced by some foreign key alter table copy_d_clients drop constraints copy_d_u_client_number.pk;

6. Add the following event to the copy_d_events table. Explain your results.

ID	NAME	EVENT_DATE	DESCRIPTION	COST	VENUE_ID	PACKAGE_CODE	THEME_CODE	CLIENT_NUMBER
140	Cline Bas Mitzvah	15-Jul-2004	Church and Private Home formal	4500	105	87	77	7125

Insert into copy_event values (7125, 140, 'client Bar mitzvah', 'Todate''15-Jul-2004', 'dd_mm_yyyy');
 church and private_home formal; venue 105, 87, 77); integrity constraint (name, copy_d_client_number.fcc)validated
 parent key not found.

7. Create an ALTER TABLE query to disable the primary key in the copy_d_clients table. Then add the values from #6 to the copy_d_events table. Explain your results.

Alter table copy_d_clients disable constraint

Copy_d_events (clients_number.pk) cannot disable constraint

8. Repeat question 6: Insert the new values in the copy_d_events table. Explain your results.

Insert into copy_d_events values (7128, 140, (line paste, Bas, b_date('15-Jul-2004, 'dd_mm_yyyy'));
church and Home formal 4500, 105, 87, 71) rows (5) inserted.

9. Enable the primary-key constraint in the copy_d_clients table. Explain your results.

Alter table copy_d_clients enable constraint copy_d_dt client_number pk;

10. If you wanted to enable the foreign-key column and reestablish the referential integrity between these two tables, what must be done?

Every value in child should have value in parent table so we need to delete or update value in child parent table container ad value.

11. Why might you want to disable and then re-enable a constraint?

Generally to make table operation first where input data is diligently sanitized and I am sure it is safe to save some in their problem.

12. Query the data dictionary for some of the constraints that you have created. How does the data dictionary identify each constraint type?

Select constraint_name, constraint_type, taste_name from ur constraint, c-check constraint

P - Primary key

R - Rererential constraint

U – Unique Key

Ex. No. : **15**

Date:

Register No.: **221701002**

Name: **P Abhignya**

Creating Views

1. What are three uses for a view from a DBA's perspective?

Provides data independence for users.

Users can view same data in different ways

View provide group of users with allows to data according to their particular permission or criterion.

2. Create a simple view called view_d_songs that contains the ID, title and artist from the DJs on Demand table for each “New Age” type code. In the subquery, use the alias “Song Title” for the title column.

Create view view_d_songs on select d_songs.id, d_songs.title “Song Title”, d_song.artist from d_songs inner join d_types on d_songs.type_code=d_type_code where d_types.description = ‘New Age’.

3. SELECT * FROM view_d_songs. What was returned?

Two rows with id (47, 49), song title and outside.

4. REPLACE view_d_songs. Add type_code to the column list. Use aliases for all columns.

Select d_songs.id, d_songs_title “Song title”, d_songs.artist d_songs type_code from d_songs inner join d_types on d_songs_type_code=d_types_code where d_types description=“New age”;

Or use alias after the CREATE statement as shown

5. Jason Tsang, the disk jockey for DJs on Demand, needs a list of the past events and those planned for the coming months so he can make arrangements for each event's equipment setup. As the company manager, you do not want him to have access to the price that clients paid for their events. Create a view for Jason to use that displays the name of the event, the event date, and the theme description. Use aliases for each column name.

Create or replace view view_o_events_IT as select name as "Event name", event_date as "Date" description as "Description" from o_events;

6. It is company policy that only upper-level management be allowed access to individual employee salaries. The department managers, however, need to know the minimum, maximum, and average salaries, grouped by department. Use the Oracle database to prepare a view that displays the needed information for department managers.

Create view department_salary.summary as select department_Pd,
Min(salary) as min_salary, max(salary) as max_salary, Avg(salary) as avg_salary from employees
Group by department_id;

DML Operations and Views

Use the DESCRIBE statement to verify that you have tables named copy_d_songs, copy_d_events, copy_d_cds, and copy_d_clients in your schema. If you don't, write a query to create a copy of each.

1. Query the data dictionary USER_UPDATABLE_COLUMNS to make sure the columns in the base tables will allow UPDATE, INSERT, or DELETE. All table names in the data dictionary are stored in uppercase.

```
Select table_name, column_name, update_table from user updatable_columns;
```

Use the same syntax but change table_name of the other tables.

2. Use the CREATE or REPLACE option to create a view of *all* the columns in the copy_d_songs table called view_copy_d_songs.

```
Create or replace view view_copy_d_songs as select*from copy_d_songs;
```

```
Select*from view_copy_d_songs;
```

3. Use view_copy_d_songs to INSERT the following data into the underlying copy_d_songs table. Execute a SELECT * from copy_d_songs to verify your DML command. See the graphic.

ID	TITLE	DURATION	ARTIST	TYPE_CODE
88	Mello Jello	2	The What	4

Insert into view_copy_d_songs (id, title, duration, artist, type_code) values (88, "MelloJello", '2', 'The what', '4')

4. Create a view based on the DJs on Demand COPY_D_CDS table. Name the view read_copy_d_cds. Select all columns to be included in the view. Add a WHERE clause to restrict the year to 2000. Add the WITH READ ONLY option.

Create or replace view read_copy_d_cols or select *from copy_d_cds where year = '2000' with check option constraint cd_read_copy_d_cds;

5. Using the read_copy_d_cds view, execute a DELETE FROM read_copy_d_cds WHERE cd_number = 90;

URA_42_399: cannot perform a DML operation on read only view.

6. Use REPLACE to modify read_copy_d_cds. Replace the READ ONLY option with WITH CHECK OPTION CONSTRAINT ck_read_copy_d_cds. Execute a SELECT * statement to verify that the view exists.

Create or replace view read_copy_d_cds on select*from copy_d_cds where year = '2000' with check option constraint ck_read_copy_d_cds;

7. Use the read_copy_d_cds view to delete any CD of year 2000 from the underlying copy_d_cds.

Delete from read_copy_d_cds where year = '2000';

8. Use the read_copy_d_cds view to delete cd_number 90 from the underlying copy_d_cds table.

Delete from read_copy_d_cds where, cd_number = '90';

9. Use the read_copy_d_cds view to delete year 2001 records.

Delete from read_copy_d_cds where year = '2001';

10. Execute a SELECT * statement for the base table copy_d_cds. What rows were deleted?

Only the one in problem 7 above, not the one in 8 and 9.

11.What are the restrictions on modifying data through a view?

Restrictions on modifying data through a view include limitations due to complex queries, lack of primary key restrictions on updatable view.

12. What is Moore's Law? Do you consider that it will continue to apply indefinitely? Support your opinion with research from the internet.

It roughly predicted the computing power nearly doubles every year. But more also said in 2005 as per nature of exponential function, the trend may not continue forever.

13. What is the “singularity” in terms of computing?

Singularity in computing refers to hypothetical future point where technological program particularly in AI, restore a storage when it fundamentally alters human civilizations.

Managing Views

1. Create a view from the copy_d_songs table called view_copy_d_songs that includes only the title and artist. Execute a SELECT * statement to verify that the view exists.

Create or replace view view_copy_d_songs on select title, artist from copy_d_songs
Select*from view_copy_songs;

2. Issue a DROP view_copy_d_songs. Execute a SELECT * statement to verify that the view has been deleted.

Drop view view_copy_d_songs;
Select* from view_copy_d_songs;

3. Create a query that selects the last name and salary from the Oracle database. Rank the salaries from highest to lowest for the top three employees.

Select*from (select last_name, salary from employees order by salary Desc) where rownum ≤3;

4. Construct an inline view from the Oracle database that lists the last name, salary, department ID, and maximum salary for each department. Hint: One query will need to calculate maximum salary by department ID.

Select employeeename, emp salary, dpt.my dept_id from(select dept.dept_id,
max(NVL(emp.salary,0))max_digit from dept.dpt left outer join employees emp.on dept.id=emp.dept_id
group by dept_dept_id dept left outer join.

5. Create a query that will return the staff members of Global Fast Foods ranked by salary from lowest to highest.

Employees empm on deptmx_dept.id+empm dept_id where NVL (emp.salary,)= dptmx max_dept_sql;
Select rownum last_name, salary from (select from f_staff order by salary;

Indexes and Synonyms

1. What is an index and what is it used for?

There are schema objects which makes retrieval of rows from table faster. An index provides direct and fast cell rows in table.

2. What is a ROWID, and how is it used?

Indexes used ROWID (based on string representation of row address containing block identifiers row location in the database).

3. When will an index be created automatically?

For primary unique keys although unique Index can be created manually but preferred should be using unique (primary constraint).

4. Create a nonunique index (foreign key) for the DJs on Demand column (cd_number) in the D_TRACK_LISTINGS table. Use the Oracle Application Express SQL Workshop Data Browser to confirm that the index was created.

Create Index d_tg_cd_number for on d_tract_listings (cd_number);

5. Use the join statement to display the indexes and uniqueness that exist in the data dictionary for the DJs on Demand D_SONGS table.

Select vi_indexname, vi.table_name, vi.uniqueness from mer_indexes vi join user_tables vt_on vi_table_name=vt.table_name where vi.table_name = 'D_songs';

6. Use a SELECT statement to display the index_name, table_name, and uniqueness from the data dictionary USER_INDEXES for the DJs on Demand D_EVENTS table.

Slect index_name, table, uniqueness from user_indexes where table_name = 'DEVENTS';

7. Write a query to create a synonym called dj_tracks for the DJs on Demand d_track_listings table.

Create synonym dj_track for d_track_listings;

8. Create a function-based index for the last_name column in DJs on Demand D_PARTNERS table that makes it possible not to have to capitalize the table name for searches. Write a SELECT statement that would use this index.

Create index d_ptr=last_name_id x on d_partners
(lower(last_name));

9. Create a synonym for the D_TRACK_LISTINGS table. Confirm that it has been created by querying the data dictionary.

Create synonym d_track for d_track_listings;

select* from user synonym where table
name=upper ('d_track_listings');

10. Drop the synonym that you created in question

Drop synonym of d_tracks;

Ex. No. : **16**

Date:

Register No.: **221701002**

Name: **P Abhignya**

OTHER DATABASE OBJECTS

Objectives

After the completion of this exercise, the students will be able to do the following:

- Create, maintain, and use sequences
- Create and maintain indexes

Database Objects

Many applications require the use of unique numbers as primary key values. You can either build code into the application to handle this requirement or use a sequence to generate unique numbers. If you want to improve the performance of some queries, you should consider creating an index. You

can also use indexes to enforce uniqueness on a column or a collection of columns.

You can provide alternative names for objects by using synonyms.

What Is a Sequence?

A sequence:

- Automatically generates unique numbers
- Is a sharable object
- Is typically used to create a primary key value
- Replaces application code
- Speeds up the efficiency of accessing sequence values when cached in memory

The CREATE SEQUENCE Statement Syntax

Define a sequence to generate sequential numbers automatically:

```
CREATE SEQUENCE sequence
[INCREMENT BY n]
[START WITH n]
[{:MAXVALUE n | NOMAXVALUE}]
[{:MINVALUE n | NOMINVALUE}]
[{:CYCLE | NOCYCLE}]
[{:CACHE n | NOCACHE}];
```

In the syntax:

sequence is the name of the sequence generator

INCREMENT BY *n* specifies the interval between sequence numbers where *n* is an integer (If this clause is omitted, the sequence increments by 1.)

START WITH *n* specifies the first sequence number to be generated (If this clause is omitted, the sequence starts with 1.)

MAXVALUE *n* specifies the maximum value the sequence can generate

NOMAXVALUE specifies a maximum value of 10^{27} for an ascending sequence and -1 for a descending sequence (This is the default option.)

MINVALUE *n* specifies the minimum sequence value

NOMINVALUE specifies a minimum value of 1 for an ascending sequence and $-(10^{26})$ for a descending sequence (This is the default option.)

CYCLE | NOCYCLE specifies whether the sequence continues to generate values after reaching its maximum or minimum value (NOCYCLE is the default option.)

CACHE *n* | NOCACHE specifies how many values the Oracle server preallocates and keep in memory (By default, the Oracle server caches 20 values.)

Creating a Sequence

- Create a sequence named DEPT_DEPTID_SEQ to be used for the primary key of the DEPARTMENTS table.
- Do not use the CYCLE option.

EXAMPLE:

```
CREATE SEQUENCE dept_deptid_seq  
INCREMENT BY 10  
START WITH 120  
MAXVALUE 9999  
NOCACHE  
NOCYCLE;
```

Confirming Sequences

- Verify your sequence values in the USER_SEQUENCES data dictionary table.
- The LAST_NUMBER column displays the next available sequence number if NOCACHE is specified.

EXAMPLE:

```
SELECT sequence_name, min_value, max_value, increment_by, last_number
```

NEXTVAL and CURRVAL Pseudocolumns

- NEXTVAL returns the next available sequence value. It returns a unique value every time it is referenced, even for different users.
- CURRVAL obtains the current sequence value.
- NEXTVAL must be issued for that sequence before CURRVAL contains a value.

Rules for Using NEXTVAL and CURRVAL

You can use NEXTVAL and CURRVAL in the following contexts:

- The SELECT list of a SELECT statement that is not part of a subquery
- The SELECT list of a subquery in an INSERT statement
- The VALUES clause of an INSERT statement
- The SET clause of an UPDATE statement

You cannot use NEXTVAL and CURRVAL in the following contexts:

- The SELECT list of a view
- A SELECT statement with the DISTINCT keyword
- A SELECT statement with GROUP BY, HAVING, or ORDER BY clauses
- A subquery in a SELECT, DELETE, or UPDATE statement
- The DEFAULT expression in a CREATE TABLE or ALTER TABLE statement

Using a Sequence

- Insert a new department named “Support” in location ID 2500.
- View the current value for the DEPT_DEPTID_SEQ sequence.

EXAMPLE:

```
INSERT INTO departments(department_id, department_name, location_id)
VALUES (dept_deptid_seq.NEXTVAL, 'Support', 2500);
```

```
SELECT dept_deptid_seq.CURRVAL FROM dual;
```

The example inserts a new department in the DEPARTMENTS table. It uses the DEPT_DEPTID_SEQ sequence for generating a new department number as follows:

You can view the current value of the sequence:

```
SELECT dept_deptid_seq.CURRVAL FROM dual;
```

Removing a Sequence

- Remove a sequence from the data dictionary by using the DROP SEQUENCE statement.
- Once removed, the sequence can no longer be referenced.

EXAMPLE:

```
DROP SEQUENCE dept_deptid_seq;
```

What is an Index?

An index:

- Is a schema object
- Is used by the Oracle server to speed up the retrieval of rows by using a pointer
- Can reduce disk I/O by using a rapid path access method to locate data quickly
- Is independent of the table it indexes
- Is used and maintained automatically by the Oracle server

How Are Indexes Created?

- Automatically: A unique index is created automatically when you define a PRIMARY KEY or UNIQUE constraint in a table definition.
- Manually: Users can create nonunique indexes on columns to speed up access to the rows.

Types of Indexes

Two types of indexes can be created. One type is a unique index: the Oracle server automatically creates this index when you define a column in a table to have a PRIMARY KEY or a UNIQUE key constraint. The name of the index is the name given to the constraint.

The other type of index is a nonunique index, which a user can create. For example, you can create a

FOREIGN KEY column index for a join in a query to improve retrieval speed.

Creating an Index

- Create an index on one or more columns.
- Improve the speed of query access to the LAST_NAME column in the EMPLOYEES table.

`CREATE INDEX index`

`ON table (column[, column]...);`

EXAMPLE:

```
CREATE INDEX emp_last_name_idx  
ON employees(last_name);
```

In the syntax:

index is the name of the index

table is the name of the table

column is the name of the column in the table to be indexed

When to Create an Index

You should create an index if:

- A column contains a wide range of values
- A column contains a large number of null values
- One or more columns are frequently used together in a WHERE clause or a join condition
- The table is large and most queries are expected to retrieve less than 2 to 4 percent of the rows

When Not to Create an Index

It is usually not worth creating an index if:

- The table is small
- The columns are not often used as a condition in the query
- Most queries are expected to retrieve more than 2 to 4 percent of the rows in the table
- The table is updated frequently
- The indexed columns are referenced as part of an Expression

Confirming Indexes

- The USER_INDEXES data dictionary view contains the name of the index and its uniqueness.
- The USER_IND_COLUMNS view contains the index name, the table name, and the column name.

EXAMPLE:

```
SELECT ic.index_name, ic.column_name, ic.column_position col_pos, ix.uniqueness
FROM user_indexes ix, user_ind_columns ic
WHERE ic.index_name = ix.index_name
AND ic.table_name = 'EMPLOYEES';
```

Removing an Index

- Remove an index from the data dictionary by using the DROP INDEX command.

- Remove the UPPER_LAST_NAME_IDX index from the data dictionary.
- To drop an index, you must be the owner of the index or have the DROP ANY INDEX privilege.

DROP INDEX upper_last_name_idx;

DROP INDEX *index*;

Find the Solution for the following:

1. Create a sequence to be used with the primary key column of the DEPT table. The sequence should start at 200 and have a maximum value of 1000. Have your sequence increment by ten numbers. Name the sequence DEPT_ID_SEQ.

create sequence dept_id_req start with 200 increment by 10 max value 1000;

2. Write a query in a script to display the following information about your sequences: sequence name, maximum value, increment size, and last number

create sequence name, max_value, incremented_by last_number from user_sequence (5);

3. Write a script to insert two rows into the DEPT table. Name your script lab12_3.sql. Be sure to use the sequence that you created for the ID column. Add two departments named Education and

Administration. Confirm your additions. Run the commands in your script.

4. Create a nonunique index on the foreign key column (DEPT_ID) in the EMP table.

Create Index empt dept_rd_ids on emp (dept_id)

5. Display the indexes and uniqueness that exist in the data dictionary for the EMP table.

Start index_name, table_name unique from user_indexed where table_name='emp';

Insert into chpt values (dept_id_seq.nextval, 'Education'),

Insert into dept values (dept_id_seq.nextval, 'Administrator');

Register No.: 221701002

Name: P Abhignya

Controlling User Access

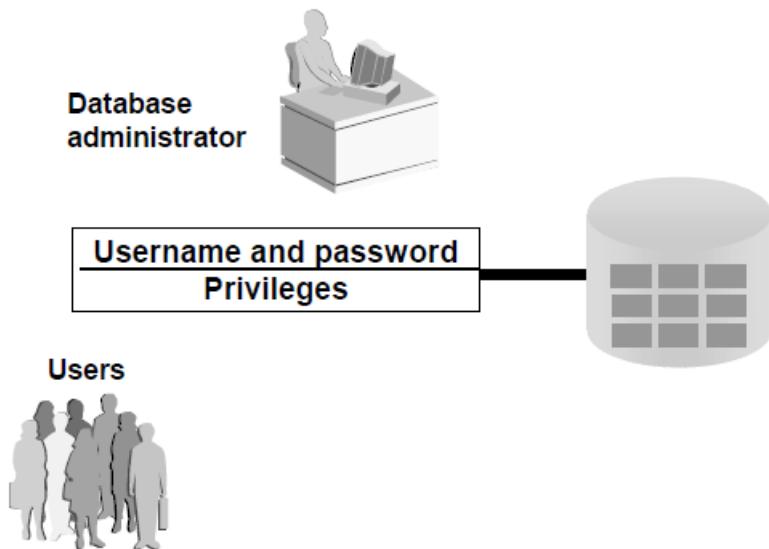

Objectives

After the completion of this exercise, the students will be able to do the following:

- Create users
- Create roles to ease setup and maintenance of the security model
- Use the GRANT and REVOKE statements to grant and revoke object privileges
- Create and access database links

P Abhignya - 221701002

Controlling User Access

Controlling User Access

In a multiple-user environment, you want to maintain security of the database access and use. With Oracle server database security, you can do the following:

- Control database access
- Give access to specific objects in the database
- Confirm given and received *privileges* with the Oracle data dictionary
- Create synonyms for database objects

Privileges

- Database security:
 - System security
 - Data security
- System privileges: Gaining access to the database
- Object privileges: Manipulating the content of the database objects
- Schemas: Collections of objects, such as tables, views, and sequences

System Privileges

- More than 100 privileges are available.
- The database administrator has high-level system privileges for tasks such as:
 - Creating new users
 - Removing users
 - Removing tables
 - Backing up tables

Typical DBA Privileges

System Privilege	Operations Authorized
CREATE USER	Grantee can create other Oracle users (a privilege required for a DBA role).
DROP USER	Grantee can drop another user.
DROP ANY TABLE	Grantee can drop a table in any schema.
BACKUP ANY TABLE	Grantee can back up any table in any schema with the export utility.
SELECT ANY TABLE	Grantee can query tables, views, or snapshots in any schema.
CREATE ANY TABLE	Grantee can create tables in any schema.

Creating Users

The DBA creates users by using the CREATE USER statement.

EXAMPLE:

CREATE USER scott IDENTIFIED BY tiger;

User System Privileges

- Once a user is created, the DBA can grant specific system privileges to a user.
- An application developer, for example, may have the following system privileges:
 - CREATE SESSION
 - CREATE TABLE
 - CREATE SEQUENCE
 - CREATE VIEW
 - CREATE PROCEDURE

GRANT *privilege* [, *privilege...*]

TO *user* [, *user|role*, PUBLIC...];

Typical User Privileges

System Privilege	Operations Authorized
CREATE SESSION	Connect to the database
CREATE TABLE	Create tables in the user's schema
CREATE SEQUENCE	Create a sequence in the user's schema
CREATE VIEW	Create a view in the user's schema
CREATE PROCEDURE	Create a stored procedure, function, or package in the user's schema

In the syntax:

privilege is the system privilege to be granted

user|role|PUBLIC is the name of the user, the name of the role, or PUBLIC designates that every user is granted the privilege

Note: Current system privileges can be found in the dictionary view SESSION_PRIVS.

Granting System Privileges

The DBA can grant a user specific system privileges.

```
GRANT create session, create table, create sequence, create view TO scott;
```

What is a Role?

A role is a named group of related privileges that can be granted to the user. This method makes it easier to revoke and maintain privileges.

A user can have access to several roles, and several users can be assigned the same role. Roles are typically created for a database application.

Creating and Assigning a Role

First, the DBA must create the role. Then the DBA can assign privileges to the role and users to the role.

Syntax

```
CREATE ROLE role;
```

In the syntax:

role is the name of the role to be created

Now that the role is created, the DBA can use the GRANT statement to assign users to the role as well as

assign privileges to the role.

Creating and Granting Privileges to a Role

```
CREATE ROLE manager;
```

Role created.

```
GRANT create table, create view TO manager;
```

Grant succeeded.

```
GRANT manager TO DEHAAN, KOCHHAR;
```

Grant succeeded.

- Create a role
- Grant privileges to a role
- Grant a role to users

Changing Your Password

- The DBA creates your user account and initializes your password.

- You can change your password by using the

ALTER USER statement.

```
ALTER USER scott
```

```
IDENTIFIED BY lion;
```

```
User altered.
```

Object Privileges

Object Privilege	Table	View	Sequence	Procedure
ALTER	✓		✓	
DELETE	✓	✓		
EXECUTE				✓
INDEX	✓			
INSERT	✓	✓		
REFERENCES	✓	✓		
SELECT	✓	✓	✓	
UPDATE	✓	✓		

Object Privileges

- Object privileges vary from object to object.
- An owner has all the privileges on the object.
- An owner can give specific privileges on that owner's object.

```
GRANT object_priv [(columns)]
```

```
ON object
```

```
TO {user|role|PUBLIC}
```

[WITH GRANT OPTION];

In the syntax:

object_priv is an object privilege to be granted

ALL specifies all object privileges

columns specifies the column from a table or view on which privileges are granted

ON *object* is the object on which the privileges are granted

TO identifies to whom the privilege is granted

PUBLIC grants object privileges to all users

WITH GRANT OPTION allows the grantee to grant the object privileges to other users and roles

Granting Object Privileges

- Grant query privileges on the EMPLOYEES table.
- Grant privileges to update specific columns to users and roles.

GRANT select

ON employees

TO sue, rich;

GRANT update (department_name, location_id)

ON departments

TO scott, manager;

Using the WITH GRANT OPTION and PUBLIC Keywords

- Give a user authority to pass along privileges.
- Allow all users on the system to query data from Alice's DEPARTMENTS table.

GRANT select, insert

ON departments

TO scott

WITH GRANT OPTION;

GRANT select
ON alice.departments
TO PUBLIC;

How to Revoke Object Privileges

- You use the REVOKE statement to revoke privileges granted to other users.
- Privileges granted to others through the WITH GRANT OPTION clause are also revoked.

REVOKE {privilege [, privilege...]|ALL}
ON object
FROM {user[, user...]|role|PUBLIC}
[CASCADE CONSTRAINTS];

In the syntax:

CASCADE is required to remove any referential integrity constraints made to the CONSTRAINTS object by means of the REFERENCES privilege

Revoking Object Privileges

As user Alice, revoke the SELECT and INSERT privileges given to user Scott on the DEPARTMENTS table.

```
REVOKE select, insert  
ON departments  
FROM scott;
```

Find the Solution for the following:

1. What privilege should a user be given to log on to the Oracle Server? Is this a system or an object privilege?

The create summon system privilege

2. What privilege should a user be given to create tables?

The create table privilege

3. If you create a table, who can pass along privileges to other users on your table?

You can or anyone given the privilege to by using the with grant option

4. You are the DBA. You are creating many users who require the same system privileges. What should you use to make your job easier?

Create a role containing system privilege and grant role to user.

5. What command do you use to change your password?

The Alter user statement

6. Grant another user access to your DEPARTMENTS table. Have the user grant you query access to his or her DEPARTMENTS table.

User 2:- Grant select on department to ,user 1>;

User 1:- Grant select on department to ,user 2>;

7. Query all the rows in your DEPARTMENTS table.

Select * from departments;

8. Add a new row to your DEPARTMENTS table. Team 1 should add Education as department number 500. Team 2 should add Human Resources department number 510. Query the other team's table.

Term 1: insert into departments (department_id, dept_name) values (500, 'Education');

Commit;

Term 2: insert into department (dept_id, dept_name) Values (500, Administration)

Commit

9. Query the USER_TABLES data dictionary to see information about the tables that you own.

Select table_name from users_table;

10. Revoke the SELECT privilege on your table from the other team.

Revoke select on department from user 2;

Revoke select on department from user 1;

11. Remove the row you inserted into the DEPARTMENTS table in step 8 and save the changes.

Team 1: Delete from department where department id = 500; commit;

Team 2: Delete from department where department id = 500; commit;

PL/SQL

Control Structures

In addition to SQL commands, PL/SQL can also process data using flow of statements. The flow of control statements are classified into the following categories.

- Conditional control - Branching
- Iterative control - looping
- Sequential control

BRANCHING in PL/SQL:

Sequence of statements can be executed on satisfying certain condition.

If statements are being used and different forms of if are:

1. Simple IF

2. ELSIF

3. ELSE IF

SIMPLE IF:

Syntax:

IF condition THEN

 statement1;

 statement2;

END IF;

IF-THEN-ELSE STATEMENT:

Syntax:

IF condition THEN

 statement1;

ELSE

 statement2;

END IF;

ELSIF STATEMENTS:

Syntax:

IF condition1 THEN

 statement1;

ELSIF condition2 THEN

 statement2;

ELSIF condition3 THEN

 statement3;

ELSE

 statementn;

END IF;

NESTED IF :

Syntax:

IF condition THEN

 statement1;

```
ELSE  
IF condition THEN  
    statement2;  
ELSE  
    statement3;  
END IF;  
END IF;  
ELSE  
    statement3;  
END IF;
```

SELECTION IN PL/SQL(Sequential Controls)

SIMPLE CASE

Syntax:

CASE SELECTOR

```
    WHEN Expr1 THEN statement1;  
    WHEN Expr2 THEN statement2;  
    :  
ELSE  
    Statement n;  
END CASE;
```

SEARCHED CASE:

CASE

WHEN searchcondition1 THEN statement1;

WHEN searchcondition2 THEN statement2;

:

:

ELSE

statementn;

END CASE;

ITERATIONS IN PL/SQL

Sequence of statements can be executed any number of times using loop construct.

It is broadly classified into:

- Simple Loop
- For Loop
- While Loop

SIMPLE LOOP

Syntax:

LOOP

statement1;

EXIT [WHEN Condition];

END LOOP;

WHILE LOOP

Syntax:

WHILE condition LOOP

statement1;

statement2;

END LOOP;

FOR LOOP

Syntax:

FOR counter IN [REVERSE]

LowerBound..UpperBound

LOOP

statement1;

statement2;

END LOOP;

PROGRAM 1

Write a PL/SQL block to calculate the incentive of an employee whose ID is 110.

DECLARE

Incentive Number (8,2);

BEGIN

SELECT salary* 0.12 INTO incentive FROM employees where employee_id = 110,

Dbms_output.put_line ('Incentive = '|| To_char (incentive));

END;

PROGRAM 2

Write a PL/SQL block to show an invalid case-insensitive reference to a quoted and without quoted user-defined identifier.

CASE 1:

Declare

```
“Welcome” varchar2(10): = ‘Welcome’;
```

```
END;
```

CASE 2:

Declare

```
WELCOME Varchar2(10) := ‘Welcome’;
```

```
Begin
```

```
    Dbms _output.put _line (“Welcome”);
```

```
END;
```

CASE 3:

Declare

```
WELCOME Varchar 2(10): = ‘Welcome’;
```

```
Begin
```

```
    Dbms_output.put_line ('Welcome');
```

```
END;
```

PROGRAM 3

Write a PL/SQL block to adjust the salary of the employee whose ID 122.

Sample table: employees

```
CREATE OR REPLACE PROCEDURE approx._salary (emp Number,
```

```
Empsal IN OUT Number,
```

```
Address Number
```

```
)IS
```

```
Salary_of_emp Number (8,2);
```

```
BEGIN
```

```
    Empsal:=empsal+addles;
```

```
END;
```

```
BEGIN
```

```
    SELECT salary INTO salary_of_emp FROM employees WHERE  
    employee_id=122;
```

```
    DBMS_Output.Put_Line ('Before invoking procedure, salary_of_emp:'||  
    salary_of_emp_;
```

```
    approx_salary (100, salary_of_emp,1000);
```

```
    DBMS_output.Put_Line ('After invoking procedure, salary_of.emp:'||  
    salary_of_emp);
```

```
END;
```

PROGRAM 4

Write a PL/SQL block to create a procedure using the "IS [NOT] NULL Operator" and show AND operator returns TRUE if and only if both operands are TRUE.

```
CREATE OR Replace procedure pribool1
```

```
    Boo_name VARCHAR2,  
    Boo_var Boolean  
 )IS  
BEGIN  
    IF bool_val is NULL THEN  
        DBMS_output.put_line (boo_name11'=NULL');  
    ELSE boo_val=True THEN  
        DBMS_output.put_line (boo_name11'=TRUE');  
    ELSE  
        DBMS_output.put_line (boo_name11'= False);  
    Endif;  
END;  
  
BEGIN  
    DBMS_output.put_line('----For m and n both false----');  
    Pri_bool(False,False);  
    DBMS_output.put_line('----For m and n both false---');  
    Pri_bool (True,False);  
END;
```

PROGRAM 5

Write a PL/SQL block to describe the usage of LIKE operator including wildcard characters and escape character.

Declare

```
Num_small      Number:= 8;
```

```
Num_large      Number:= 5;
```

```
Num_temp      Number;
```

BEGIN

```
If num_small > num_large  then
```

```
    Num_temp:= num_smal;
```

```
    Num_small:= num_large;
```

```
    Num_large:= num_temp;
```

```
Endif;
```

```
DBMS_output.put_line ('num small = '|| num_small);
```

```
DBMS_output.put_line ('num large = '||num_large);
```

PROGRAM 6

Write a PL/SQL program to arrange the number of two variable in such a way that the small number will store in num_small variable and large number will store in num_large variable.

```
DECLARE

    PROCEDURE pat_match (
        Test_string Varchar 2;
        Pattern Varchar 2;
    ) IS

        BEGIN

            IF      test_string LIKE pattern THEN
                DBMS_output.put_line ('True');
            ELSE
                DBMS_output.put_line ('False');
            END IF;

        END;

BEGIN

    Pat_match ('Blweate', 'B%a_e');

    Pat_match ('Blweate', 'B%A_E');

END;
```

PROGRAM 7

Write a PL/SQL procedure to calculate the incentive on a target achieved and display the message either the record updated or not.

DECLARE

```
PROCEDURE test 1(
    Sal_achieve NUMBER,
    Target_qty NUMBER,
    Emp_id NUMBER
)
```

IS

```
Incentive NUMBER:= 0;
Updated Varchar 2(3) := 'NO';
```

BEGIN

```
IF sal_achieve > (target_qty-1200) THEN
    Incentive:= (sal_achieve_target_qty)/4;
    Update emp set salary = salary + incentive where employee_id = emp_id;
END IF;

DBMS_Output.Put_line ('Table updated ? ||updated||,'
    ||'incentive =' ||incentive ||',');
```

```
END test 1;

BEGIN

    Test 1 (2300, 2000, 144);

    Test 1 (3600, 3000, 145);

END;
```

PROGRAM 8

Write a PL/SQL procedure to calculate incentive achieved according to the specific sale limit.

```
DECLARE

    PROCEDURE test 1 (sal_achieve NUMBER)

        Is incentive NUMBER := 0

    BEGIN

        IF sal_achieve > 44000 THEN

            Incentive := 1800;

        ELSEIF sal_achieve > 32000 THEN

            Incentive := 800;

        ELSE

            Incentive := 500;

        END IF;
```

```
DBMS_output.New_line;  
  
DBMS_output.put_line ('sale achieved: "'|| sal_achieve 1)  
  
\incentive:'||incentive|| ',' );  
  
END TEST 1;
```

```
BEGIN  
  
Test 1 (45000);  
  
Test 1 (36000);  
  
Test 1 (28000);
```

```
END;
```

,PROGRAM 9

Write a PL/SQL program to count number of employees in department 50 and check whether this department have any vacancies or not. There are 45 vacancies in this department.

```
DECLARE  
  
Tot_emp NUMBER;  
  
BEGIN
```

```

SELECT COUNT (*) INTO tot_emp FROM employees e JOIN departments d 00
e.department_id = d.department_id where e.department_id = 50

Dbms_output.put_line ('The employees are in the department 50: '|| To_char
(tot_emp);

IF tot_emp >= 45 THEN

dbms_output.put_line ('There are no vacancies in the department 50.');

Else

dbms_output.put_line ('There are some vacancies in department 50');

END IF;

END:

```

PROGRAM 10

Write a PL/SQL program to count number of employees in a specific department and check whether this department have any vacancies or not. If any vacancies, how many vacancies are in that department.

DECLARE

```

tot_emp NUMBER;

get_dept_id NUMBER;

BEGIN

get_dept_id:= '& new_dept_id';

```

```

SELECT count (*) INTO tot_emp FROM employees e
join department d ON e.department_id =
d.department_id where e.department_id =
get_dept_id;

PROCEDURES AND FUNCTIONS

PROCEDURES

DEFINITION

A procedure or function is a logically grouped set of SQL and PL/SQL statements that perform a specific task. They are essentially sub-programs. Procedures and functions are made up of,

- Declarative part
- Executable part
- Optional exception handling part

These procedures and functions do not show the errors.

KEYWORDS AND THEIR PURPOSES

REPLACE: It recreates the procedure if it already exists.

PROCEDURE: It is the name of the procedure to be created.

ARGUMENT: It is the name of the argument to the procedure. Paranthesis can be omitted if no arguments are present.

IN: Specifies that a value for the argument must be specified when calling the procedure ie. used to pass values to a sub-program. This is the default parameter.

OUT: Specifies that the procedure passes a value for this argument back to its calling environment after execution ie. used to return values to a caller of the sub-program.

INOUT: Specifies that a value for the argument must be specified when calling the procedure and that procedure passes a value for this argument back to its calling environment after execution.

RETURN: It is the datatype of the function's return value because every function must return a value, this clause is required.

PROCEDURES – SYNTAX

```
create or replace procedure <procedure name> (argument {in,out,inout} datatype ) {is,as}
variable declaration;
constant declaration;
begin
PL/SQL subprogram body;
exception
exception PL/SQL block;
end;
```

FUNCTIONS – SYNTAX

```
create or replace function <function name> (argument in datatype,.....) return datatype {is,as}
variable declaration;
constant declaration;
begin
PL/SQL subprogram body;
exception
exception PL/SQL block;
end;
```

CREATING THE TABLE ‘ITITEMS’ AND DISPLAYING THE CONTENTS

```
SQL> create table ititems(itemid number(3), actualprice number(5), ordid number(4), prodid number(4));
```

Table created.

```
SQL> insert into ititems values(101, 2000, 500, 201);
```

1 row created.

```
SQL> insert into ititems values(102, 3000, 1600, 202);
```

1 row created.

```
SQL> insert into ititems values(103, 4000, 600, 202);
```

1 row created.

```
SQL> select * from ititems;
```

ITEMID	ACTUALPRICE	ORDID	PRODID
101	2000	500	201
102	3000	1600	202
103	4000	600	202

PROGRAM FOR GENERAL PROCEDURE – SELECTED RECORD’S PRICE IS INCREMENTED BY 500 , EXECUTING THE PROCEDURE CREATED AND DISPLAYING THE UPDATED TABLE

```
SQL> create procedure itsum(identity number, total number) is price number;
```

2 null_price exception;

3 begin

4 select actualprice into price from ititems where itemid=identity;

```

5 if price is null then
6 raise null_price;
7 else
8 update ititems set actualprice=actualprice+total where itemid=identity;
9 end if;
10 exception
11 when null_price then
12 dbms_output.put_line('price is null');
13 end;
14 /

```

Procedure created.

SQL> exec itsum(101, 500);

PL/SQL procedure successfully completed.

SQL> select * from ititems;

ITEMID	ACTUALPRICE	ORDID	PRODID
101	2500	500	201
102	3000	1600	202
103	4000	600	202

PROCEDURE FOR 'IN' PARAMETER – CREATION, EXECUTION

SQL> set serveroutput on;

SQL> create procedure yyy (a IN number) is price number;

```

2 begin
3 select actualprice into price from ititems where itemid=a;
4 dbms_output.put_line('Actual price is ' || price);

```

```
5 if price is null then  
6 dbms_output.put_line('price is null');  
7 end if;  
8 end;  
9 /
```

Procedure created.

```
SQL> exec yyy(103);  
Actual price is 4000  
PL/SQL procedure successfully completed.
```

PROCEDURE FOR ‘OUT’ PARAMETER – CREATION, EXECUTION

```
SQL> set serveroutput on;
```

```
SQL> create procedure zzz (a in number, b out number) is identity number;  
2 begin  
3 select ordid into identity from ititems where itemid=a;  
4 if identity<1000 then  
5 b:=100;  
6 end if;  
7 end;  
8 /
```

Procedure created.

```
SQL> declare  
2 a number;  
3 b number;  
4 begin  
5 zzz(101,b);
```

```
6 dbms_output.put_line('The value of b is '|| b);
7 end;
8 /
```

The value of b is 100

PL/SQL procedure successfully completed.

PROCEDURE FOR ‘INOUT’ PARAMETER – CREATION, EXECUTION

```
SQL> create procedure itit ( a in out number) is
2 begin
3 a:=a+1;
4 end;
5 /
Procedure created.
```

```
SQL> declare
2 a number:=7;
3 begin
4 itit(a);
5 dbms_output.put_line('The updated value is '||a);
6 end;
7 /
```

The updated value is 8

PL/SQL procedure successfully completed.

CREATE THE TABLE ‘ITTRAIN’ TO BE USED FOR FUNCTIONS

```
SQL>create table ittrain ( tno number(10), tfare number(10));
Table created.
```

```
SQL>insert into ittrain values (1001, 550);
1 row created.
```

```
SQL>insert into ittrain values (1002, 600);
1 row created.
```

```
SQL>select * from ittrain;
```

TNO	TFARE
1001	550
1002	600

PROGRAM FOR FUNCTION AND IT'S EXECUTION

```
SQL> create function aaa (trainnumber number) return number is
2 trainfunction ittrain.tfare % type;
3 begin
4 select tfare into trainfunction from ittrain where tno=trainnumber;
5 return(trainfunction);
6 end;
7 /
```

Function created.

```
SQL> set serveroutput on;
```

```
SQL> declare
2 total number;
3 begin
4 total:=aaa (1001);
```

```
5 dbms_output.put_line('Train fare is Rs. '|total);
6 end;
7 /
```

Train fare is Rs.550

PL/SQL procedure successfully completed.

TRIGGER

DEFINITION

A trigger is a statement that is executed automatically by the system as a side effect of a modification to the database. The parts of a trigger are,

- **Trigger statement:** Specifies the DML statements and fires the trigger body. It also specifies the table to which the trigger is associated.
- **Trigger body or trigger action:** It is a PL/SQL block that is executed when the triggering statement is used.
- **Trigger restriction:** Restrictions on the trigger can be achieved

The different uses of triggers are as follows,

- *To generate data automatically*
- *To enforce complex integrity constraints*
- *To customize complex securing authorizations*
- *To maintain the replicate table*
- To audit data modifications

TYPES OF TRIGGERS

The various types of triggers are as follows,

- **Before:** It fires the trigger before executing the trigger statement.
- **After:** It fires the trigger after executing the trigger statement
- .
- **For each row:** It specifies that the trigger fires once per row
- .
- **For each statement:** This is the default trigger that is invoked. It specifies that the trigger fires once per statement.

VARIABLES USED IN TRIGGERS

- :new
- :old

These two variables retain the new and old values of the column updated in the database. The values in these variables can be used in the database triggers for data manipulation

SYNTAX

create or replace trigger triggername [before/after] {DML statements}

on [tablename] [for each row/statement]

begin

exception

```
end;
```

USER DEFINED ERROR MESSAGE

The package “raise_application_error” is used to issue the user defined error messages

Syntax: raise_application_error(error number,‘error message’);

The error number can lie between -20000 and -20999.

The error message should be a character string.

TO CREATE THE TABLE ‘ITEMPLS’

```
SQL> create table itempls (ename varchar2(10), eid number(5), salary number(10));
```

```
Table created.
```

```
SQL> insert into itempls values('xxx',11,10000);
```

```
1 row created.
```

```
SQL> insert into itempls values('yyy',12,10500);
```

```
1 row created.
```

```
SQL> insert into itempls values('zzz',13,15500);
```

```
1 row created.
```

```
SQL> select * from itempls;
```

ENAME	EID	SALARY
-------	-----	--------

xxx	11	10000
-----	----	-------

yyy	12	10500
zzz	13	15500

TO CREATE A SIMPLE TRIGGER THAT DOES NOT ALLOW INSERT UPDATE AND DELETE OPERATIONS ON THE TABLE

SQL> create trigger ittrigg before insert or update or delete on itempls for each row

```
2 begin
3 raise_application_error(-20010,'You cannot do manipulation');
4 end;
5
6 /
```

Trigger created.

SQL> insert into itempls values('aaa',14,34000);

insert into itempls values('aaa',14,34000)

*

ERROR at line 1:

ORA-20010: You cannot do manipulation

PL/SQL procedure successfully completed.

Program 1

Write a code in PL/SQL to develop a trigger that enforces referential integrity by preventing the deletion of a parent record if child records exist.

Create or replace trigger prevent_parent_delete before delete on departments for each row

DECLARE

V_cound number;

BEGIN

Select count (*) into V_count from employees where department_id =
:OLD.department_id;

If v_cound > 0 then

Raise_application_error (-20001, 'cannot delete department with associated employees');

Endif;

END;

Delete from departments where department_id = 10

Output:

ORA – 20001: cannot delete department with associated employe

Program 2

Write a code in PL/SQL to create a trigger that checks for duplicate values in a specific column and raises an exception if found.

Create or replace trigger prevent_duplicates

Before insert on departments for each row

DECLARE

V_count number;

BEGIN

Select count (*) into v_count from departments where department_name = :
New.department_name,

If v_count > 0 then

raise_application_error (-20002, 'Department name already exists');

endif;

END;

insert into departments (department_id, department_name, manager_id,
location_id) values (110, 'Finance', 108, 1700);

Output:

ORA – 20002 : Department name already exists.

Program 3

Write a code in PL/SQL to create a trigger that restricts the insertion of new rows if the total of a column's values exceeds a certain threshold.

Create or replace trigger restrict_insert before insert on employees for each row

DECLARE

total_amount number;

max_threshold number := 80000;

BEGIN

Select sum(salary) into total_amount from employees if total_amount +
NEW.salary > max_threshold Then raise_application_error (-20003, 'cannot add
employee, company's budget cannot support salary');

endif;

end;

insert into employees value (207, 'Snekha', 'Ramkumar', 'snekharan1224@gmail.com',
9444568216, '24-05-2005', 'AD-PRES' – 100000, 0.5, null, 10);

OUTPUT

ORA – 2003: cannot add employee, company's budget cannot support salary.

Program 4

Write a code in PL/SQL to design a trigger that captures changes made to specific columns and logs them in an audit table.

Create table salary_audit (audit_id number primary key, employee_id number, old_salary number, new.salary number, change date timestamp);

Create sequence seq_salary_audit start with 1 increment by 1;

Create or replace Trigger audit_10g_salary after update on employees for each row when
(New.salary < > old.salary)

DECLARE

V_auid_id number;

BEGIN

Select seq_salary_audit. NEXTVAL into V_audit_id from dual;

Insert into salary_audit (V_audit_id, NEW_employee_id, OLD.salary, New.salary,
sysdate);

END;

Update employees set salary = 100000 where employee_id = 100

Select * from salary_audit;

Output

audit_id,	employee_id,	old_salary	New Salary	Change date
1	100	24000	100000	17-MAY-24
				05 5512740847PM

Program 5

Write a code in PL/SQL to implement a trigger that records user activity (inserts, updates, deletes) in an audit log for a given set of tables.

Create table audit_log (log_id number primary key, table_name varchar 2(100), activity_type, varchar 2 (20);

Activity_date.timestamp, user_id varchar 2(50));

Create sequence audit_log_seq startwith, increment by 1;

Create or replace trigger Employee_audit_trigger after insert or update or delete on employee for each row

DECLARE

V_activity_type Varchar2 (20);

BEGIN

```
if inserting then  
    V_activity_type:= ‘INSERT’;  
  
else if updating then  
    V_activity_type:= ‘UPDATE’;  
  
Else if deleting then  
    V_activity_type:= ‘DELETE’;  
  
end if  
  
insert into audit_log values (audit_log_seq.NEXTVAL,’Employee’. V-  
activity_type, SYSTEMSTAMP, USER);  
END;
```

```
Update employees set salary = 2400 where employee_id = 100;  
  
delete from employees where employee_id = 203;  
  
select * from audit_log;
```

log_id	Table_name	Activity_type	Activity_date	User
--------	------------	---------------	---------------	------

Program 6

Write a code in PL/SQL to implement a trigger that automatically calculates and updates a running total column for a table whenever new rows are inserted.

```
Create      table sales (
```

```
        sale_id number primary key,
```

```
        sale_date Date,
```

```
        amount_number, running_total number);
```

```
create or replace trigger update_running_total
```

```
before insert on sales for each row
```

```
BEGIN
```

```
If new.running_total is NULL Then select NVL (max (running_total)),0) + : NEW  
amount into : NEW.running_total from sales;
```

```
Else
```

```
    New.running = total::: New.running_total<= New.amount;
```

```
Endif
```

```
END;
```

```
insert into sales values (1, '05-01-2024', 100);
```

```
insert into sales values (2, '05-01-2024', 200);
```

```
insert into sales values (3, '05-01-2024', 150);
```

```
select * from sales;
```

Output:

Sale_id	Sale_date	Amount	running_total
1	05-01-2024	100	100
2	05-01-2024	200	300
3	05-01-2024	150	450

Program 7

Write a code in PL/SQL to create a trigger that validates the availability of items before allowing an order to be placed, considering stock levels and pending orders.

Create table products (pid number primary key, pname varchar 2 (20), pquantity number);

Create table orders (oid number primary key, pid number, quantity number);

Create or replace trigger check_quantity (before insert on orders for each row

DECLARE

Stock_quantity number;

BEGIN

Select pquantity in stock_quantity from products where pid = New.pid;

If: NEW.quantity > stock_quantity THEN

Raise_application_error (-20004, 'stocks not available');

End;

Insert into products (1, 'pencil', 10);

Insert into orders (1,1,9);

Insert into orders (2,1,2);

Output

ORA-20004: Stock not available.

MONGO DB

Ex. No. : **20**

Date:

Register No.: **221701002**

Name: **P Abhignya**

MONGO DB

MongoDB is a free and open-source cross-platform document-oriented database. Classified as a NoSQL database, MongoDB avoids the traditional table-based relational database structure in favor of JSON-like documents with dynamic schemas, making the integration of data in certain types of applications easier and faster.

[Create Database using mongosh](#)

After connecting to your database using mongosh, you can see which database you are using by typing db in your terminal.

If you have used the connection string provided from the MongoDB Atlas dashboard, you should be connected to the myFirstDatabase database.

[Show all databases](#)

To see all available databases, in your terminal type show dbs.

Notice that myFirstDatabase is not listed. This is because the database is empty. An empty database is essentially non-existent.

[Change or Create a Database](#)

You can change or create a new database by typing use then the name of the database.

[Create Collection using mongosh](#)

You can create a collection using the createCollection() database method.

[Insert Documents](#)

[insertOne\(\)](#)

```
db.posts.insertOne({  
    title: "Post Title 1",  
    body: "Body of post.",  
    category: "News",  
    likes: 1,  
    tags: ["news", "events"],  
    date: Date()  
})
```

db.restaurant.find({“grades.date”: ISODate(‘2014-08-11 TOO:00:007’),  
 “grades.grade”: “A”, “grades.score”: []}, {  
 “restaurant_id”:1, “name::1, “grades”: 1}
```

- 3. Write a MongoDB query to find the restaurant Id, name and grades for those restaurants where the 2nd element of grades array contains a grade of "A" and score 9 on an ISODate "2014-08-11T00:00:00Z".**

```
db.restaurant.find({“grades.date”: “A”, “grades.1.score”:9, “grades.1.date”:  
 ISODate(‘2014-08-11 TOO:11:007’)}, {restaurant_id:1, name:1, grades:1})
```

- 4. Write a MongoDB query to find the restaurant Id, name, address and geographical location for those restaurants where 2nd element of coord array contains a value which is more than 42 and upto 52..**

```
db.restaurant.find ({“address.coord.1”: {$He: 52, $gt:42}}, {restaurant_id:1,  
 name:1, coord:1, address:1})
```

5. Write a MongoDB query to arrange the name of the restaurants in ascending order along with all the columns.

```
db.restaurant.find().sort ({“name”:1});
```

6. Write a MongoDB query to arrange the name of the restaurants in descending along with all the columns.

```
db.restaurant.find().sort ({“name”:-1});
```

7. Write a MongoDB query to arranged the name of the cuisine in ascending order and for that same cuisine borough should be in descending order.

```
db.restaurant.find().sort ({“cuisine”:1, “borouogh”: -1});
```

8. Write a MongoDB query to know whether all the addresses contains the street or not.

```
db.restaurant.find ({“address.street”: {$exists:true}})
```

9. Write a MongoDB query which will select all documents in the restaurants collection where the coord field value is Double.

```
db.restaurant.find({“address.coord”: {$type:”double”}})
```

10. Write a MongoDB query which will select the restaurant Id, name and grades for those restaurants which returns 0 as a remainder after dividing the score by 7.

```
db.restaurant.find ({grades.score”:{$t:5}}, {name:1} )
```

11. Write a MongoDB query to find the restaurant name, borough, longitude and attitude and cuisine for those restaurants which contains 'mon' as three letters somewhere in its name.

```
db.restaurant.find ({“name”:{$regex:”mon.*”}}, {name:1, borouogh:1, “address.coord”:1, cuisine:1})
```

12. Write a MongoDB query to find the restaurant name, borough, longitude and latitude and cuisine for those restaurants which contain 'Mad' as first three letters of its name.

```
db.restaurant.find ({“name”: {$regex: “^Mad”}}, {name:1, borough:1, “address.coord”:1, cuisine:1})
```

13. Write a MongoDB query to find the restaurants that have at least one grade with a score of less than 5.

```
db.restaurant.find|>{"grades.score":{$lt:5}}, {"name:1}
```

14. Write a MongoDB query to find the restaurants that have at least one grade with a score of less than 5 and that are located in the borough of Manhattan.

```
db.restaurant.find({grades.score":{$lt:5}, "borough":"manhattan"})
```

15. Write a MongoDB query to find the restaurants that have at least one grade with a score of less than 5 and that are located in the borough of Manhattan or Brooklyn.

```
db.restaurant.find ({$and:[{$or: [{"borough":"Manhattan"}, {"borough": "Brooklyn"}]}, {"grades.score": {$lt: 5}}]})
```

16. Write a MongoDB query to find the restaurants that have at least one grade with a score of less than 5 and that are located in the borough of Manhattan or Brooklyn, and their cuisine is not American.

```
db.restaurant.find({$and:[{$or:[{borough:"Manhattan"}, {borough:"Brooklyn"}]}, {"grades.score":{$lt:5}}, {cuisine:$ne:"American"}]})
```

17. Write a MongoDB query to find the restaurants that have at least one grade with a score of less than 5 and that are located in the borough of Manhattan or Brooklyn, and their cuisine is not American or Chinese.

```
dn/restairamt/fomd ({$and:[{"grades.score":2}, {"grades.score": 6}]})
```

18. Write a MongoDB query to find the restaurants that have a grade with a score of 2 and a grade with a score of 6.

```
db.restaurant.find ({$and:[{"grades.score":2}, {"borouogh":"Manhattan"}, {"grades.score":6}])
```

19. Write a MongoDB query to find the restaurants that have a grade with a score of 2 and a grade with a score of 6 and are located in the borough of Manhattan.

```
db.restaurant.find ({$and: [{"grades.score":2}, {"borough":"Manhattan"}, {"grades.score":6}]})
```

20. Write a MongoDB query to find the restaurants that have a grade with a score of 2 and a grade with a score of 6 and are located in the borough of Manhattan or Brooklyn.

```
db.restaurant.find({$and:[{"grades.score":2}, {"borouogh:$in:["Manhattan", "Brooklyn"]}]})
```

21. Write a MongoDB query to find the restaurants that have a grade with a score of 2 and a grade with a score of 6 and are located in the borough of Manhattan or Brooklyn, and their cuisine is not American.

```
db.restaurant.find ({$and:[{"grades.score":2}, {"grades.score":6}, {"borough": {$in:["Manhattan", "Brooklyn"]}}, {"cuisine": {$ne: "American"}}]})
```

22. Write a MongoDB query to find the restaurants that have a grade with a score of 2 and a grade with a score of 6 and are located in the borough of Manhattan or Brooklyn, and their cuisine is not American or Chinese.

```
db.restaurant.find ({$and:[{"grades.score":2}, {"grades.score":6}, {"borough": {$in:["Manhattan", "Brooklyn"]}}, {"cuisine": {$nin:"American", "Chinese"}}]})
```

23. Write a MongoDB query to find the restaurants that have a grade with a score of 2 or a grade with a score of 6.

```
db.restaurant.find ({$or: [{"grades.score":2}, {"grades.score":6}]})
```

Sample document of 'movies' collection

```
{  
  _id: ObjectId("573a1390f29313caabcd42e8"),  
  plot: 'A group of bandits stage a brazen train hold-up, only to find a determined posse hot on their heels.'
```

genres: ['Short', 'Western'],
runtime: 11,
cast: [
 'A.C. Abadie',
 '"Gilbert M. 'Broncho Billy' Anderson",
 'George Barnes',
 'Justus D. Barnes'
],
poster: 'https://m.media-amazon.com/images/M/MV5BMTU3NjE5NzYtYTYYNS00MDVmLWIwYjgtMmYwYWIxZDYyNzU2XkEyXkFqcGdeQXVyNzQzNzQzI@._V1_SY1000_SX677_AL_.jpg',
title: 'The Great Train Robbery',
fullplot: "Among the earliest existing films in American cinema - notable as the first film that presented a narrative story to tell - it depicts a group of cowboy outlaws who hold up a train and rob the passengers. They are then pursued by a Sheriff's posse. Several scenes have color included - all hand tinted.",
languages: ['English'],
released: ISODate("1903-12-01T00:00:00.000Z"),
directors: ['Edwin S. Porter'],

```

1. Find all movies with full information from the 'movies' collection that released in the year 1893.

```
db.movies.find ({year:1983})
```

2. Find all movies with full information from the 'movies' collection that have a runtime greater than 120 minutes.

```
db.movies.find ({runtime: {$gt:120}})
```

3. Find all movies with full information from the 'movies' collection that have "Short" genre.

```
db.movies.find ({genres: "short"})
```

4. Retrieve all movies from the 'movies' collection that were directed by "William K.L. Dickson" and include complete information for each movie.

```
db.movies.find ({directors: "William K.L.Dickson"})
```

5. Retrieve all movies from the 'movies' collection that were released in the USA and include complete information for each movie.

```
db.movies.find ({countries: "USA"})
```

6. Retrieve all movies from the 'movies' collection that have complete information and are rated as "UNRATED".

```
db.movies.find ({"rated":"UNRATED"})
```

7. Retrieve all movies from the 'movies' collection that have complete information and have received more than 1000 votes on IMDb.

```
db.movies.find ({"imbd.votes":{$gt:1000}})
```

8. Retrieve all movies from the 'movies' collection that have complete information and have an IMDb rating higher than 7.

```
db.movies.find ({"imbd.rating": {$gt: 7}})
```

9. Retrieve all movies from the 'movies' collection that have complete information and have a viewer rating higher than 4 on Tomatoes.

```
db.movies.find ({"tomatoes.viewer.rating": {$gt:4}})
```

10. Retrieve all movies from the 'movies' collection that have received an award.

```
db.movies.find ({"awards": {$exists:true}})
```

11. Find all movies with title, languages, released, directors, writers, awards, year, genres, runtime, cast, countries from the 'movies' collection in MongoDB that have at least one nomination.

```
db.movies({“awards.nominations”:{$gt:0}}, {“title”:1, “languages”:1, “released”:1, “directors”:1, “writers”:1, “awards”:1, “year”:1, “genres”:1, “runtime”:1, “cast”:1, “countries”:1})
```

12. Find all movies with title, languages, released, directors, writers, awards, year, genres, runtime, cast, countries from the 'movies' collection in MongoDB with cast including "Charles Kayser".

```
db.movies.find({“cast”:”charleskayser”}, {“title”:1, “languages”:1, “released”:1, “directors”:1, “writers”:1, “awards”:1, “year”:1, “genres”:1, “runtime”:1, “cast”:1,
```

“countries”:1})

13. Retrieve all movies with title, languages, released, directors, writers, countries from the 'movies' collection in MongoDB that released on May 9, 1893.

```
db.movies.find ({released:ISODate('1893-05-09T00:00:00Z')}, {"title":1,  
"languages":1, "released":1, "directors":1, "writers":1, "countries":1})
```

14. Retrieve all movies with title, languages, released, directors, writers, countries from the 'movies' collection in MongoDB that have a word "scene" in the title.

```
Db.movies.find ({title:@sceneli}, {"title":1, "languages":1, "released":1, "directors":1,  
"writers":1, "countries":1})
```
